Seton joined the first of October, and the "Introductory Remarks" of the newly appointed Professor of the Institute of Medicine were duly published

in Canada Medical Review Journal Oct. 1895 - p. 202-207

[Of reforms in medical teaching]

\* \* \* In this spirit the course you are about to begin has been inaugurated. An opportunity will henceforth be afforded to the students attending this School of becoming practically acquainted with the use of the microscope in physiology and pathology; and I may venture to congratulate McGill College as the first in this country to offer such a course, and in so doing to be the first to conform in all respects to the requirements of the College of Surgeons of England, which demand that such shall be provided.

The first essential in a course like this is a proper supply of good microscopes, every student must be furnished with one to enable him to follow out the demonstrations with any degree of satisfaction. These have been obtained from Dr. Hartnack of Paris and Potsdam, and are the same as are in use in the chief laboratories of Europe. No microscope maker, British or foreign, has yet (as far as my experience goes) made up an instrument at all to be compared with compact, Hartnack's students' microscope. // XXX

It ends with the hope that the course that newly inaugurated contained enough promise of still better things - ~~was~~ <sup>to be under the superintendence</sup> a ~~profess~~ <sup>profess</sup> equipped physiological laboratory and the services of a skilled assistant, ~~was made~~ <sup>some</sup> -

The Geniculate Calcanei Pathway and Meyer Loop.

It is important to understand the anatomical position of the visual pathway and particularly the junction the fibres which cross beneath the temporal lobe loops about the horn of the ventricle as Meyer <sup>accurately</sup> first described them.

Meyer's best indicated in the drawings.

The fibres are selective - the lower fibres (despite the relay and <sup>after they leave</sup> new distribution of the retinal segment at the geniculate body) correspond with fibres relay with the fibres from the lower half of the retina on the corresponding side - the upper with the upper. Hence an injury to the lower part of the temporal loop causes a defect in the upper homonymous field - an injury of the upper fibres a defect in the lower homonymous field, as we shall see.

These defects  $\therefore$  may be more or less quadrantal or sector shaped or related as in Fig 2 in case the def. injury is a sharply cut one.

But more important and less easily explained is the fact that one eye may suffer much more than the other in the process.

wa.  
Father Johnson evidently joined <sup>at his time</sup> the long defunct visit to Montreal and  
apparently stayed with the Jones' cousins where Ester and his friends  
were constant visitors. Throughout his life he was a great hand to  
drop in upon people for brief visits - all too brief for their recipients.  
In an ~~account~~ article ~~on~~ written long afterwards in which he had  
occasion to speak of the troubles which affected his friends and College

George says he says:

"As a young man in Montreal there were two doors I never passed, -  
47 and 49 Union Avenue; going up I called on Dr. Palmer Howard, and if he  
was out it or was engaged I called on Dr. George Ross; going down the reverse.  
Any growth in virtue as a practical clinician I owe to an intimate  
association with these two men, in whom were combined in rare measure  
enthusiasm and clear vision."

Transient Attacks of Aphasia or Can. Med. Assoc. Journ. Oct. 1911

He ~~was~~ was at the Howards practically a member of the family and invariably  
had his Sunday dinner there but was his cousin; he was <sup>intimately</sup> or was  
more intimate than and was a close visitor. Shortly after Johnson's  
visit another cousin Jennette joined the household on finding that  
her sister was threatened with typhoid and as she says stayed  
for the next ~~to~~ sixteen years.

From W. T. COUNCILLMAN'S Article:-  
Graduating Class in Med. 1875

He gives the usual good advice to the students, telling them to keep up their reading, to observe patients well, and even at this early period introduces Sir Thomas Browne, but he does not use him effectively. It seems by far the worst thing he ever published; there is no trace of humor in it, and no indication of the remarkable power he showed in his later addresses.

Summer 1875:

He must have given the summer in the small fox ward; and in pathological ward or there was for in the face he read before the Med. Chi. Society his report on a case of *omnis fery* (Anthraxosis) a rare disease condition in venereal subjects. The patient had died of erysipelas small fox in his ward during the summer. His elaborate pathological and histological studies of the case is the highest order of merit.
