

In answer to your question I have
state what I know of the only
deputy who probably might be kept
by the Mr. Means by going with
the nearest

1 clay structures of the low Means
banks & tubules of clay fossils are
in beds almost vertical between
Mean beam but are not always
due of sufficient importance to afford
a certain supply of fuel but might
be useful in some cases.

2 hematite veins of South
Maine but these are good
and are of excellent quality
of fuel - 50 to 60 percent. Please do
specimens not known but believe to
be large veins - 10 miles from
Maine

3 great ore bed of Upper New
Brunswick has been found but
it is not known how far it extends
west - regular bed of fuel striking
west 40 percent. Some of the fuel
is 20 percent of metal.

4. Spotters contents of Gr.
A vein of pyrite that is carrying
As the pyrite is rather low K
about 8 miles from the mines
Sample yielded 55 percent Iron

5. Iron ore of Ankerite 10 miles
from Peter mines & carried
over 2 1/2 miles to Ankerite Station
Among the contents were a lot
of Pyrite and much of the
ankerite quantity

6. Iron ore of Morris 7 miles
to an old site of gold & silver
There are Magnetite in some and
suitable for blast furn. but yield
60 percent and very values
for blast furnace with pump up
Working with the water readily
quite abundant of 8 1/2 to 10
percent of pyrite by 1 1/2 to Peter
There is also noted to be here
and put up at by St Paul but

Chandernagore Pp 271, 344, 581

I shall probably be well
like your opinion and will be
glad to send the localities and
attend any important demand and
report and; but first for the age
of the camp, or put away do well
that my to keep in the report

Copy to
Chandernagore
