

Scientific Club,
7, Savile Row, W.

Oct 28 1895.

My dear Sir

Thank you very much for your
kind letter & the three pamphlets.

Your idea of a supplement is very
practical. I often wonder why
such supplements are not paid to
compare with the books themselves,
such as page 52 A. 52 B, &c &c,
so on, or a piece, to be bound in
with the original work.

I am writing to order the works
you refer me to.

I have before me an interesting
specimen in the shape of a microscopical
section I had made of a basalt
broken up with no end of a strain
on the rock, by the Trawentoy a
year or so since when getting the
broken end of the cable. It was
broken in Lat. $50^{\circ}30'N$ or
long. $24^{\circ}46' W$. rather beyond
the usual track of ice bergs,
can it be a bit of the bottom
or an ice deposit in old times
or lastly an eccentric ice berg on
an independent cruise? And is the

does not to think for a probability
of the bottom sticking through?

I shall make original
payment in a day or two, &
write a memorandum for some
biological periodical, to fish for
facts. It is a pretty problem.

Yours very truly

Marshall Hall

Principal Dawson.

Mr. Wall
