

Copy of Descriptions
Oct 1880

I have recently obtained a very
interesting series of Upper De-
vian plants found with
Fleming's with some fossils
as *Boya de Cholera*, and
hope to send them down
to you a few pieces and to
you plants in *Boya de Cholera*
and what you tell me
of fossils etc. etc.

I am from *Boya de Cholera*
that the us large *Boya de Cholera*
found in PL XLIX by I as
Archaeopteryx etc. is really
the same with the *Boya de Cholera*
of the new *Boya de Cholera*
I also in *Boya de Cholera*
I have still large specimens of
Boya de Cholera which I will
send to the *Boya de Cholera*.

2 *Boya de Cholera* is the

That this fern belong to
Archaeopteris? & another
Name as to its fruit? Its
Venation & form of the fronds
are entirely different.

2. The Arch. form is
not in plants designated for
A. Wimmeria of Grew
with which I see Schimper
compare it. How far are
Culm. distinct characters.

3. The Arch. form
Wimmeria appears to me
by me to be Cyclopteris
Bumelia for Perry of
which I have no better
specimen than its work of
Pursh which was by Pursh
(in traps in a new specimen)

4. Do you know any of the leaf
of a plant in Seed of Decaying
Perry as a plant for Pursh. I have a
plant? - It is P123 is another name
a common kind of tall tree plant.
