Note on specimens of Ptilophyton and
associated fossils, collected by A. H. S.
Williams in the Chemung shales of
Phoenicia, New York — by J. M. Dawson,
of Montreal, Canada

The author ^[abstract] discussed the affinities of
the plant published in the original New York
Reports under the name Filicites varianensis,
which he had subsequently described as
Lycopodites varianensis, and had still
more recently referred to his new
genus Ptilophyton; but which has
been referred by Prof. Hall to Hydrozooids
under the name Plumalina Plumosa. Some
new specimens, obtained by A. Williams, and
found associated with stipes of ferns and
fragments of Ptilophyton, as well as with

Some plants referable to the genus Rhodesia,
were described, and were held to show
that the plant organism in question
is really a plant, though possibly an
aquatic one, and should be united
with the similar species from the
Devonian and Lower Carboniferous,
in the genus Phyllophyta.
