

My dear Sir

I send you today a copy of our Bulletin No 2 which may be of interest to you on account of the first two articles. You will see that I am still interested in the study of the surface deposits of this vicinity, as well as the Cambrian.

There is a good deal relative to the ~~Torryburn~~ Marl or, which I have not yet put into shape for an article, but which will be

published I hope in future
numbers of the Bulletin.
There is the geology of the
district and the Biology of the
Mollusca &c. &c. as material
for future articles - the latter
is particularly interesting in its
relation to the question of de-
velopment. Do you know
anyone who is well acquainted
with the northern forms of mollus-
ca (freshwater) of N. America?
The grouping of species in these
parts is different from what now
prevails here, and I suspect
will find its counterpart further
north.

We would like to
send the Bulletin in exchange

to other societies so far as
it can be arranged, and
hope that you may be
able to suggest some open-
ings perhaps on the other
side of the Atlantic, as well
as ^{on this} ~~there~~, where it would be
acceptable.

Mr. Hay's article on
the Botany of the Upper St.
John confirms the discovery
of Goodale of the western
facies of its Flora; and adds
a number of additional
species to those already enu-
merated as of Western and Southern
range.

Remain dear sir

yours very truly
L. B. Mattoon

Matthews
