

July 10, 1893 -

Wrote to rep. papers showing open to
Saratoga Co. N.Y. show state of health
found for an organ so old. Also
to have been the plates - which the
open by hand filled in with 52 people
meets depart from the appearance of
cannibal of the set or even the
that of the more recent softness
found in compact with the
in by paper -

The sand, ^{canon} open to find have the
to that and should be disposed to
regard them as certain - Concretions but
of an obscure appearance of Concrey
fills a mass of the animal, I must
never have more more than made
and a little further study of them. It
most curious variety that in which
the lacunae are crushed and when
apparently they were filled with
hard material -

(as coming from you) in my report
of the Cambria Fauna.

The Potsdam specimens you
may retain. Those from the
Grand Cañon, I am obliged to ask
be returned. The specimens from
the Grand Cañon are mentioned
in an article on the pre-Carbon-
iferous Strata in the Grand
Cañon of the Colorado, Arizona,
(see American Journal Science Vol.
XXVI Dec. 1883, page 441)

Anticipate returning to the
Grand Cañon during the season
of 1885 & will endeavor to obtain
more of this material.

Any further information,
I can give is at your service.

Very truly yours,

Charles Walcott.
