

Partridge Island,
Parrsboro'
Nova Scotia
17 August, 1894.

Sir J. W. Dawson,

Dear Sir:

Will you kindly indicate to me the locality where the footprints found by Dr. Harding of Windsor many years ago at Parrsborough on sandstone were mined? I find general reference to them in your "Salient Points," &c. but have been unable to learn the exact locality.

Prof. Hitchcock (Dartmouth College) and I have

Trabun

"Hill Rocks" (east of last
 ridge Island) but can find
 no suggestion of life beyond
 a narrow shelf
 shell of two, through riffs
 marks G. S. P. around.

From several numbers
 passed here from quite fossil
 is with the fruitful local-
 ties about, but none reaches
 where there are riffs tracks
 of the hardy could have
 come from.

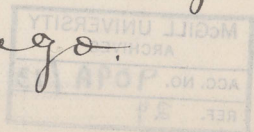

Had the pleasure of
 meeting you at Jaggins in
 1871, and just missed you
 there two weeks ago

~~been~~ carefully over "Sugar Hill Rocks" (north of Partridge Island) but can find no suggestion of life beyond ~~a mussel shell~~ mussel-shell or two, though ripple marks &c. abound.

From several summers passed here I am quite familiar with the fruitful localities about, but have no idea where these reptile tracks of Dr. Hardings could have come from.

I had the pleasure of meeting you at Foggins in 1891, and just missed you there two weeks ago.

Any information you can give me as to
fruitful spots near Bartidge Island will be
most gratefully received. by yours

Very truly,
S. V. Clearborn.
