My dear Mr William

On my return from the Continent (on Thursday evening) I found your letter awaiting me and was very glad to find that you thought I had given a fair account of the way in which Eozon occurs - For the inaccuracies I am sorry: the one is merely the result of not rightly catching the name. The other

(The hamlet) must come from some
inaccuracy at the time, for I had
the impression from what I wrote
that there were a few houses
scattered to the valley or shallow
basin. The difficulty is
the matter, whether one take the
organic or the mineral view,
seen to me equally great,
but I am afraid my visit
shook rather than confirmed
my faith - The globular

boetic what you mention seems
to me very interesting, but I presume
they come out of some mountain
of the Sierrita. I think that,
having regard to the great
mineral changes which obviously
have taken place in the so-called
granites of the Laurentian,
the preservation of any small
fragments would ^{not} be a possibility.
Cageon, if I mistake not, for
his 'relics' in the 'Schistes de

A do - rock barely altered.
Some of them like our English Cam-
brian -

I am very glad that you still
wield the hammer. I was writing
you and Smith Joggins only a few
weeks ago to a sketch of Lyell
which I hope to send you in the
autumn, and a book also is
coming in 'Ice work'. It is sad
how as one gets older friends
pass away - but we are not as
there is some hope. May you
be spared us long. Kind remem-
brances to Lady Dawson
Sincerely yours
T. G. Bonney
