

Copper ore comes out a black soft stuff I burned a piece in a common wood fire. Copper in the metallic state shows on it in plenty I have some samples and would like to see what else or what is in it. Also about twenty miles from this I found a Silver mine, - in mica-State this stands all on edge the lead is say 18 or 24 in in width the silver is the Black variety and all I saw wore of a prismatic shape

Also I was taken to a place and a well was dug the water is sweet I detected lead in looking over the land I found samples scattered over two hundred acres. I make at a great lead deposit some where there. I have looked at mineralogy a little, - found potters Clay. &c. would you think Copper would be laid upon iron? I mistrust such a freak -
