Dr Harrington  
McGill University  
Montreal

Dear Doctor

Do you know any likely men to  
take on in our assay office? I expect one  
or two openings in that department almost  
any day; in fact, I would take one man  
if he were here, now.

The new-comer would have to start at  
the bottom, of course. We really need  
a fire man most.

Mac Nab (Queen's) & myself are doing the  
chemical work. In fact I have done very  
little analysis this year; but have spent  
most of my time working on magnetic  
separation of zinc ores, & more recently  
am trying to find out a little about metallurgy.

CANADIAN SMELTING WORKS,  
TRAIL, BRITISH COLUMBIA.

Stewart & Swillim are both with us again.  
Though both are out in the hills.

Everything indicates quite a number of  
openings in the next year or so here.

The company has put the smelter into  
a new division & called it the Department  
of Mines & Minerals. This takes in the  
Coal & Iron areas as well as this concern.

Mr Aldridge is managing the whole thing  
& therefore he will take all the men he  
can from here & put them out in the  
other branches & break in new ones here.

I am sending you a couple of  
specimens one runs 99.5% of Tellurium &  
the other you will know more about by looking  
at than by analysis.

Hoping that your family & yourself are all in  
good health

I am

Yours respectfully

D. S. Haylock

We have just heard of the  
first flight race safe mourning.

Handwritten notes on the left margin, including the name "D. G. Blaylock" and other illegible cursive text.

Main body of handwritten cursive text, appearing to be a letter or a set of notes, written in a fluid, slanted hand.

Continuation of handwritten cursive text, including a large, clear signature "Letter to D. G. Blaylock" in the center-right area.
