1890
1891

May 28, 1898. Sir Henri Joly de
Lobiniere, Minister of Land Rev.
being anxious that I should visit
the scene of a remarkable & destructive
land slide in his constituency, Parish
of St. Therese on R. Blanche, arranged
to do so in his company. Left for
Montreal at 6 P.M. met Sir Henri
there at 11 P.M. & took train for
Frondeville, near Quebec.

May 29. Arrive Frondeville 4 am.
Drove to St. Cassin & then on to
St. Therese. Examined & photographed
land slide & got train back from
Frondeville at 3 P.M. Stopped some
time at St. Martin Junction & then
on to Ottawa, arriving at 1 am,
May 30.

The first part of the book is devoted to a general
 introduction of the subject. The author discusses the
 history of the subject and the various methods
 which have been employed. He then proceeds to
 a detailed description of the various parts of
 the system. The second part of the book is
 devoted to a description of the various parts
 of the system. The author discusses the
 various parts of the system and the methods
 which have been employed. He then proceeds to
 a detailed description of the various parts
 of the system. The third part of the book
 is devoted to a description of the various
 parts of the system. The author discusses the
 various parts of the system and the methods
 which have been employed. He then proceeds to
 a detailed description of the various parts
 of the system. The fourth part of the book
 is devoted to a description of the various
 parts of the system. The author discusses the
 various parts of the system and the methods
 which have been employed. He then proceeds to
 a detailed description of the various parts
 of the system. The fifth part of the book
 is devoted to a description of the various
 parts of the system. The author discusses the
 various parts of the system and the methods
 which have been employed. He then proceeds to
 a detailed description of the various parts
 of the system. The sixth part of the book
 is devoted to a description of the various
 parts of the system. The author discusses the
 various parts of the system and the methods
 which have been employed. He then proceeds to
 a detailed description of the various parts
 of the system. The seventh part of the book
 is devoted to a description of the various
 parts of the system. The author discusses the
 various parts of the system and the methods
 which have been employed. He then proceeds to
 a detailed description of the various parts
 of the system. The eighth part of the book
 is devoted to a description of the various
 parts of the system. The author discusses the
 various parts of the system and the methods
 which have been employed. He then proceeds to
 a detailed description of the various parts
 of the system. The ninth part of the book
 is devoted to a description of the various
 parts of the system. The author discusses the
 various parts of the system and the methods
 which have been employed. He then proceeds to
 a detailed description of the various parts
 of the system. The tenth part of the book
 is devoted to a description of the various
 parts of the system. The author discusses the
 various parts of the system and the methods
 which have been employed. He then proceeds to
 a detailed description of the various parts
 of the system.

Aug. 10. 98. Had planned to
leave for a few days in N.S.
yesterday, to go over some of
the formations in doubt there
with Ami, but getting telegram
from W.A. Frazer, in charge of
boring operations in Alberta
which indicate further trouble
with Pelican hole, I thought it
best to go there first. Left this
evg.

Aug. 11. On C.P.R. going west.

Aug. 12. " " "

In new cuttings at Dinarmik
Station, not far east of Loebjorn,
notice stratified contorted
clays or silts, some beds near
as at the top red, like the red
clays of Kamministigens valley.
If the same, this would probably
carry these clays up to a
much higher level.

Aug. 13. On C.P.R. going W.

Aug. 14. Arrive Calgary 3 Am.

The first of the three
 parts of the book
 is the history of the
 world from the beginning
 to the present time
 and is written in a
 simple and plain style
 which is very easy to
 understand. The second
 part is a description of
 the different parts of
 the world and the
 customs and manners
 of the people who
 inhabit them. The third
 part is a collection of
 the most interesting
 events which have
 happened in the world
 since the beginning of
 the Christian era.

Aug. 15. Leaves for Edmonton & am.
train. arrive 7 P.m.

Aug. 16. Got off with team in P.m.
for Victoria. Drove about 30 m.
before dark & put up at settler's
shanty for the night.

Aug. 17. Continue on to Victoria. Put
up there with Gillis, telegraph
operator.

Aug. 18. At well nearly all day.
Put down thermometer, but got it
jammed at bottom of well, with
sand-pump. Making fishing tool
to extract it. Took photos. of rig etc.

Aug. 19. Got remains of thermometer
& the sand-pump out this am.
Left for Edmonton in P.m. Drove to
Edna.

Aug 20. On to Edmonton, arriving
about 4:30

Aug. 21. Sunday. Talk with Francis
about business at Pelican &
Victoria. He found abandoned
as no more progress possible
because of gas & tar-sand. Men on

the way back. Arrange with F. to send these men down to Victoria when they arrive & work double time there, with hope of getting full depth this season. Arranging about accounts & about tools etc to be brought from Pelecin to Victoria. also about new string of $3\frac{5}{8}$ Coring for Victoria.

Aug. 22. Drive to vicinity of Big Egg L., about 27 miles to see tar or petroleum found there. The place that Edmonton people wanted boring operations to be conducted at originally. Returned in P.M., reaching Edmonton at 6 P.M.

The tarry matter was first found at the surface, in ploughing, on ^{S.W.?} N.E. quarter, Sect 30. Range 25, W of 4. An excavation made showed layers of tar soaked sand at depths of 8 or 10 feet, & according to E. Lyons, a second similar layer exists at greater depth. W. Pearce, who carried out some borings, one to depth

The first part of the book is devoted to a general survey of the history of the world, from the beginning of time to the present day. The author discusses the various stages of human civilization, from the primitive state to the modern world. He also touches upon the different religions and philosophies that have shaped human thought and action.

The second part of the book is a detailed account of the political and social changes that have taken place in the world since the end of the last century. The author analyzes the causes and consequences of these changes, and offers his own views on the future of the world. He discusses the rise of the nation-state, the development of the modern world, and the challenges that the world is facing today.

The third part of the book is a study of the human mind and its powers. The author explores the nature of human intelligence, the limits of human knowledge, and the role of the individual in society. He discusses the different schools of thought that have developed over the centuries, and offers his own views on the nature of the human mind.

The fourth part of the book is a study of the human condition. The author discusses the various aspects of human life, from the physical to the spiritual. He explores the nature of human happiness, the meaning of life, and the role of the individual in the world. He offers his own views on the human condition, and discusses the ways in which we can improve our lives.

The fifth part of the book is a study of the human future. The author discusses the various challenges that the world is facing, and offers his own views on the ways in which we can overcome these challenges. He discusses the role of science and technology, the importance of education, and the need for a new world order.

of 120 feet, say 150 yards N.E. of
Excavation (or north easterly from)
stake that he passed through 8 feet soil
& clay, 8" tar sand. Then 'hard clay'
(boulder-clay, probably) to 40 feet, above
layer of sand & gravel with water which
rose to the surface. Then soft & hard
Sandstone (Taramie?) grey & brownish,
to 120 feet.

It appears to be certain that the tarry
matter was really found here & pieces
of it may also be picked up in the
material thrown out from excavation, &
it seems probable that it may have
reached the surface layers by means of
fissures extending to a great depth.
This implies considerable fluidity.
On another lot, said to be S.W. quarter
Section of 31, same range, a remarkable
spring or mine hole, not copious, but
with emission of sulphuretted hydrogen.
Another of the same kind & slightly
Saline, intermediate between this
& the tar occurrences & all three
nearly in N & S (two) lines. Seem

The first thing I noticed when I stepped
 out of the plane was the fresh air.
 It felt like a warm blanket after a long
 winter. The sun was shining brightly,
 and the birds were chirping happily.
 I took a deep breath and smiled.
 This was my first time in a new
 country, and I was excited to see
 everything. The people were friendly
 and the food was delicious. I had
 heard that the weather was perfect,
 and it was true. I was in luck.
 I had heard that the people were
 friendly, and they were. I had
 heard that the food was delicious,
 and it was. I had heard that the
 weather was perfect, and it was.
 I was in luck. I had heard that

 heard that the weather was perfect,
 and it was. I was in luck.

to indicate a fissure with the Course,
or if not, then the outcrop of a porous
bed of the Taramie with the strata,
with which fissure or fissures have
communicated. In latter case seem
to prove continuity of petroleum-bearing
conditions this far to the westward,
consequently enlarging the probable
field.

Elevation of Country near the place
where Harry Wollter found, by barometer,
seems to be about 540' above the
town of Edmonton.

Aug 23. Took a skiff up the river on
S. side on waggon & launched it
above Big Island, for the purpose of
visiting dredges & noting gold mining
on the river.

Just above Big I. several miners at
work on beach & bar along river.
Some of them working on exposed
bar, though water rather high at present,
others stripping from 5' to 8' of sand,
same as that forming the low wooded
flat here, & expose underlying bed of

[Faint, illegible handwriting on a grid background]

Gravel which affords moderate amt.
of the usual very fine gold. Gravel washed
out & washed at edge of river by hand
with jigging & blankets. \$1.50 a day
stated to be about as much as can be
made at present. (See photo of apparatus).

Star Mining Co. of S. Edmonton

H.W. Shepherd president. Dredge
working on N. bank of river about 2 m.

above Big J. Is an ordinary
scoop dredge, the bucket being swung
round & emptied into jigging with

blankets, of the usual type,
at one side. 12 H.P. Engine.

Digging at present 9' below water
level, which about its capacity. Three
full buckets make a cubic yard &

about 40° in gold per cubic yard

saved. Paying well at present,

although a good deal of the ^{very} fine gold
known to be lost. Whole machine

somewhat primitive & rough in

construction & acknowledged to be

susceptible of improvement, particularly
in the matter of imparting motion to the tables.

[Faint, illegible handwriting on a grid background, likely bleed-through from the reverse side of the page.]

Gold actually secured said to be
from \$25 to \$40 per day. 3 men &
a boy employed.

Loveland & Bros. at work in S.
Channel at Big S. Dredge formerly
employed laid up there. New dredge
has been at work only about a week.
Same type of dredge as Port, but much
larger & thoroughly constructed. Two
engines each 20 h.p. - one for ~~working~~^{pumping}
water for washing. Can raise 3
buckets a minute, $\frac{3}{4}$ yard to a
bucket when full, but sometimes come
up only half full. Expect to be able
to wash all that can be raised when
arrangements completed. At present
a temporary arrangement of rigging &
blankets fixed to side of dredge.
Later intend to elevate the gravel &
wash it at the stern

About 2 miles above town, another
small dredge, but not now at
work & no one on board. This again
on same general plan, but with a

Car or truck on rails in which
dirt is drawn up to stern of dredge
for treatment. Grizzly & revolving
perforated iron cylinder for screening
gravel before washing over blankets.
This is Dr. Bowers' dredger.

Dr
Bowers.

Several hand dredges on the
river. Saw one of these, a sort of
Cotawaran, or scow with long
opening in it forward, in which
a scoop like arrangement worked
on the end of a pole & with the
aid of a chain to lift it. Usual
washing arrangements. 3 men.
Seems a pretty poor & slow business.
Saw probably 12 men working
grizzlies at different places along
the banks, but river too high
yet for much work.

Aug. 24. Walked down to Frazer's
Mill to see tusk found on a bar
in the river about 50 m up, nr.
Goose Encampment. It is a rather
small mammoth tusk, with the
outer end broken off & a good deal
worn. Offered Frazer \$10 for it, but
he would not take it.
Walked up river along bank to
see other dredges.

↳ Brindley's dredge, now on the
bank, a small affair, resembling
that last described & with similar
arrangement for elevating spawls.
Said to have made about \$10 a
day. Latterly employed dredging
in connection with bridge piers

↳ Braithwaite's dredge, further up
& partly submerged near the bank.
This is another small primitive
dredge with small engine used
in pumping water etc. 2 longitudinal
wells in the scow in which
scoops dredges on poles operated,
apparently chiefly by hand labour

[Faint, illegible handwriting on a grid background]

Crossed the river to S. side, where at
Walker's Mill a large & substantial
dredge in course of construction for
the Finance Discovery Corporation
of London. This company has
taken over Orlet's gold leases.
The dredge will operate by an endless
chain of buckets, raising the
gravel to hopper 25-feet above the
deck, where, after removal of large
stones by jugs it will be screened
in revolving perforated cylinder.
Fine stuff will pass onto 4 (or 6?)
Fine Vanuvers, for separation
of gold. These to be placed on deck
aft. The dredge will be worked by
winches & ropes & will be
lined along the river to require
places. 4 Engines to be on board
1 for Chain of buckets, 1 for
winches & 2 for pumping water.
This is altogether the largest &
best constructed machine seen
& Loveland's is the next in
these respects.

also building a small stern wheel
steamer for tender, to carry coal etc.

[Faint, illegible handwriting on a grid background]

The low wood steam dredger
rigged up some years ago &
named Notre Dame de Mistassini
is now a long way up the river
& not at work, I am informed.

Aug. 25. From Edmonton to Calgary,
arriving at 7 P.M.

Aug. 26. Train at 2:55 A.M., going
west. Arrive Banff about 6 A.M.

To C.P.R. Hotel. In P.M. drive to
Anthracite with S. Sawbe, who
was on train & stays here for
some days after completion of
collecting work on Red Deer.

Get photos of mine houses & of
boulder-clay bluffs & specimens
of boulder-clay.

The cliffs of drift deposits near
Anthracite & running S.E. along
Valley thence, consist largely of
pale hard boulder ~~stone~~ clay,
holding many well glaciated
stones, but with this much clayey

The first thing I noticed
 when I stepped out
 of the car was the
 smell of fresh air
 and the sound of
 birds chirping in
 the trees. It felt
 like I had been
 trapped in a box
 for a long time
 and I was finally
 free. The sun was
 shining brightly
 and the sky was
 a clear, vibrant
 blue. I took a
 deep breath and
 felt a sense of
 peace and
 tranquility. It was
 exactly what I
 needed. I walked
 slowly, enjoying
 every moment of
 the day. The
 breeze was
 refreshing and
 the world around
 me was so
 beautiful. I
 felt like I had
 found a new
 world. I was
 so happy and
 grateful. I
 was finally
 home.

stratified gravel, a bed of coarse
sand etc. The boulder clay is
probably the oldest, but the whole series
of irregularly stratified deposits with
it appear to be likely about contemp-
oraneous & probably formed in
water at or near the foot of a
retreating local glacier of the
Valley. Whether of the Alaskan
stage or a later reappearance of
glaciers in the mountains, doubtful.

Scarcely probable under any
hypothesis that these boulder-clays
hold any warm microzoa, but
specimens collected for examination
Aug. 27. Train late this morning
& able therefore to get breakfast
at 7 am before leaving hotel. Arrive
at Kaulook near midnight.

Aug. 28. Drove this morning
with Mr H.G. Achby, manager, to
Pot Hook Mine, Mr. Sugar Loaf
Hill. Met Mr Parks the M.E.
in charge & looked over the deposit
& work. The group of claims is

[Faint, illegible handwriting on a grid background]

Situated near the little patch of
Sedimentary Tertiary shown on my map
between Sugar Loaf & Cherry Bluff
roads. The ground is all much broken
up & very puzzling, but in several
there seems to be an irregular zone,
of considerable thickness of the
gabbro & associated rocks, charged
with greater or less quantities of
Copper pyrites, grey copper & native
Copper. The matrix is a
brecciated mass in general, & it
would appear that parts of this breccia
material are more or less water bedded,
probably resembling materials
associated with the Cool at Guernsey
etc & underlying basalt of Drifflin
Hill - therefore Traquell's beds.
Some of the lines which Parker
takes for walls of vein seem to
be the bedding planes of this
character, as e.g. that on the
Midnight fractional claim, where
the dip is distinctly S50E.

[Faint, illegible handwriting on a grid background]

It seems to me of no use to follow
any of the supposed walls, for the
one is admittedly not confined by
the ~~others~~ & the main object should
be to determine if possible a zone
of well-defined character rich
enough to work, by concentration
or otherwise. Gold & silver values
are small & the ore must be
regarded as essentially a copper
ore.

On the same group of claims &
quarry in the same E-W Wg.
direction, but to the N. of the
Copper Run, an important deposit
of mag. iron like that of Cherry Bluff
has lately been found. Iron
occurs in the various outcrops
& is not a single continuous
vein, constitutes a run of lenticular
pieces by ~~possibly~~ ~~quarry~~ through
the whole group of claims. Similar
ore found in Sugar Loaf Mt.
itself.

The first thing I noticed
 when I stepped out of the
 car was the fresh air. It
 felt like a warm blanket.
 The sun was shining brightly
 and the birds were singing.
 I took a deep breath and
 felt my heart rate increase.
 It was a beautiful surprise.
 I had never felt this way
 before. The world seemed
 so much more alive than
 I had ever experienced.
 I was in luck. The weather
 was perfect. The temperature
 was just what I needed.
 I had heard that the weather
 was bad, but it was actually
 perfect. I was in luck.
 The first thing I noticed
 when I stepped out of the
 car was the fresh air. It
 felt like a warm blanket.
 The sun was shining brightly
 and the birds were singing.
 I took a deep breath and

Interview with Mr Wood in Pen.
about claims with marking on
Shurwop sheet, getting specimens
of same & them from him.

Aug. 29. Leave for Vernon by train
at 1.15 am. Arrive at Sicaunous
& change alt. 5 am. Reach

Vernon 8.30 am. Call on Mr. Turnbull
to inquire about mineral claims
here, within limits of ~~Kearney~~

Shurwop sheet. In Pen with him
to Bon Diable group, about 4 m.

away. This place was visited by
McCowell & McEoy last year, &
the ore appears to occur in
association with a peculiar

eruptive rock. (See McCowell's
specimens & notes) Blackish schists

appear in junction with the
grey buffy ditto & sometimes
schistose rock in question, at

one of the openings dipping very
distinctly $N 20^{\circ} W \angle 20^{\circ}$. The
quartz appears to follow zones in

[Faint, illegible handwriting on a grid background, likely bleed-through from the reverse side of the page.]

These rocks on the Contact zone.

Probably we defined lead of large size, but much quartz which could be financed from surface to begin with. Shows very rust on iron pyrites, but assays in some cores said to have been very high in gold. No work now in progress. Claims being held mostly by annual work.

Aug. 30. With Mr. F.H. Lotimer to visit Blue Jay mine, situated about a mile S.W. of Swan Lake, in the Hills. Shaft 40' & tunnel 175' feet intersecting vein at depth of 100 feet. The vein cannot be followed far on surface, but is well defined in the works. Str. N ⁴⁵° W with dip N.E. \angle 60°. It is generally three or four feet wide with mixture of crushed rock & quartz, holding pyrites, a little galena & decomposed yellow material near hanging wall in shaft said to have been very

high assays in gold, although
no free gold showing. Everything
looks favorable enough for further
work of assays satisfactory, although
the broken character of all this tract
of country between Swan & Okanagan
Lakes may render it difficult to
follow runs far. Country rock is
a sort of grey 'diabase' considerably
shattered & sometimes slickensided.

The 'Falcon' Claim, about $1/2$ m.
W. shows pockets containing free gold
quite rich. Claims along the N.
side of Bay on which Okanagan
Landing situated have also
yielded good specimens of free
gold.

Leave by afternoon train & reach
Sicamous about dark.

Aug. 31. Sicamous to glacier

Sept. 1. Leave glacier this am. &
arrive Calgary midnight.

Sept. 2. At Calgary. Visit two sandstone
quarries with Mr. Pearce. No wire

[Faint, illegible handwriting on a grid background, likely bleed-through from the reverse side of the page.]

from Ottawa & therefore conclude that I
may go to Wadood as intended. Wire
from Fraser. Barry of Victoria down
1250 feet. Wants slight change in
order for Casey. Wrote Ottawa
about this.

The C. P. R. Sandstone quarry, in
Parcupine Hill beds of Laramie, opened
in bank on S. side of Bow about 3
miles west of Calgary. The bank is here
probably 150' high, the quarry being opened
on a band of sandstone about 30' thick
& about half-way up. Shales about 25'
thick have to be stripped by pick & shovel
& barrow. As the work goes back to
the full height of bank the stripping
will be soon done, but it is probable
that additional layers of good sandstone
will be found above. The sandstone
is somewhat irregularly & obscurely
bedded, but is traversed by frequent
vertical jointage planes. It breaks
out freely in irregular shaped lumps,
but is soft & easily dressed, of a

[Faint, illegible handwriting on a grid background]

Light brown colour. Some irregular
layers bluish grey on fresh fracture &
much harder. These are regarded as
inferior. The stone worked is very
soft in the quarry but hardens
considerably on exposure & appears
to stand the weather well in buildings
in Calgary. It is of a pleasing
appearance in walls, whether hammer
drummed or finely dressed.

The second quarry visited belongs to
Mrs Edworthy. It is about half
a mile further up the river, in a
coulee. The stone similar to the last,
but comes out in better shaped
pieces. Face about 25 feet & stripping,
consisting of gravel, at present only
about 70 feet. The sandstone appears
to occupy a horizon stratigraphically
a little above that worked in the
other quarry. The stone is being taken
from this quarry for the new C.P.R.
Station at Vancouver.

[Faint, illegible handwriting on a grid background]

Sept. 3. Calgary to Macleod.

Sept. 4. Sunday. at Macleod.

Telegraphed ^{to} that address this
Wednesday night would be Macleod.

Sept. 5. Leave at 9 am by New Crow Nest
Ry for Fernie, at mouth of Cool Cr. on
Elk R. Arrive there 6 Pm.

Between Macleod & Scott's Coulee
notice numerous cuts, some 20' or
more deep, in well stratified grey
& brownish silts. Similar seen at
intervals beyond, especially about
& beyond crossing of S. Fork Oldman.
These cuts are somewhat finer &
appear to approach clays in some
layers. That often singularly
crumpled  thus. Difficult
to understand exactly how caused.
These silts here seem to be of irregular
thickness or distinct boulder clay,
without any well marked line
to be seen in passing between the two.
The plain about 73 miles front
(Crowley) seems to be about the
natural level of these silts, which

[Faint, illegible handwriting on grid paper]

have been rounded away by
denudation toward the valleys. Hence,
adequate exposures not seen till
present ex. cuts made. The level
just referred to seems to be about
the same with the highest well marked
terraces along N. side of Middle Fork
valley opposite.

^{Just beyond}
~~at~~ 56.8 m. (Lapandeur), Pincher ck.
crossed at mouth. Good exposures of
nearly horizontal Paleozoic sandst.
Fine view of trough of Oldman Valley.
Bridge crossing of S. Fork & beyond,
numerous fine exposures of tilted
Laramie or Cretaceous rocks - largely
sandstones.

at 92 m. Sulphur spring.

at 98 m. outcrop of volcanic beds
of Cretaceous.

Sept. 6. Drove about 5 m. from
Fermie up Coal Creek to place
where Cool Co's mines are being
opened up by Mr. Blakemore. Spur
line is finicited up to this place.

The first part of the paper
 was devoted to a general
 survey of the subject
 and to a discussion of the
 various methods of
 investigation. The second
 part was devoted to a
 detailed study of the
 various methods of
 investigation. The third
 part was devoted to a
 detailed study of the
 various methods of
 investigation. The fourth
 part was devoted to a
 detailed study of the
 various methods of
 investigation. The fifth
 part was devoted to a
 detailed study of the
 various methods of
 investigation. The sixth
 part was devoted to a
 detailed study of the
 various methods of
 investigation. The seventh
 part was devoted to a
 detailed study of the
 various methods of
 investigation. The eighth
 part was devoted to a
 detailed study of the
 various methods of
 investigation. The ninth
 part was devoted to a
 detailed study of the
 various methods of
 investigation. The tenth
 part was devoted to a
 detailed study of the
 various methods of
 investigation.

Large yard is being graded & other work in progress for erection of bins, screens & loading facilities for the coal. Drifts opened on both sides of valley, the most important being on S. Side. They are just about to open this up into rooms, work is also in progress for the installation of 100 coke ovens at Fernie, with the intention of doubling or trebling this later. Fire bricks from Wales, landed at cost of \$ 80 per M. Dam is being made on Coal Ck. below the mines to deliver water for power etc at Fernie under 200' head.

Mr Fernie is also opening out trial drifts on coal seams beside railway far up on Michel Ck. These are recognized as much lighter than those opened on Coal Ck, one being equivalent to the Peter seam, first prospecting near Martin Creek. (Write Blakemore for thickness of seams being opened.)

Our Fernie informs me that
explorations here showed that the
Coal field is interrupted by
limestone for a good many miles
between Michel Ck & Fording R.
Also that an area of coal measures
occurs to W. of Elk R., but not
very large.

Note westerly dip at $\angle 40^\circ$ or so in
Qy. Cots a mile or two N. of
Fernie on Elk. The rocks to
W. of Elk may here be Cr. as shown
opposite. Looks also like an area
of the same kind opposite mouth
of Michel Ck.

(Write Fernie for particulars)

altogether it looks as though the
Cr. very probably passes under the
limestone along W. side of Elk, along
an overthrust fault. Structure
similar to that found so characteristic
by McConell further north. If so
would have important bearings on
extent of coal field & would change
section as given in my map

The first thing I noticed
 when I stepped out of the plane
 was a sense of freedom and relief.
 It felt like I had been
 trapped in a cage for years.
 The fresh air and the
 sound of birds chirping
 were a welcome change.
 I had been told that
 the weather was perfect.
 They were right. It was
 just what I needed.
 I had been so stressed
 and overwhelmed.
 Now I was finally
 able to breathe.
 The sun was shining
 brightly, and the
 clouds were so soft.
 I had never felt
 so happy before.
 It was a new beginning.
 A chance to start
 over and live the
 life I always wanted.
 I was free.

It also seems very probable that the same structure occurs along the E. edge of the Tuts. in vicinity of Crow Nest Pass, the lower southern part of Turtle Mt. eg. looking like Cretaceous.

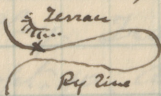

The Sulphur Spring would occur along line of this fault.

It is also possible that the same overthrust occurs at line of lower end of Crow Nest Lake, & even possible that the Crow's Nest Mt. may be an outlier of the limestone overthrust left by denudation.

This structure not recognized as in mind at time of previous examination.

Informed that a hot spring occurs 18 mi. up the Elk Valley from Michel Ck, on E. side of river.

Sept. 7. Left Fernie yesterday about noon, & after long delays reach Macleod about 11 am. today.

Fail to recognize any exposures
of boulder-clay distinctly such in
the numerous & large sq. cuts in
Mountains or in road cuts on
Coal Ck. Frequent exposures of
mixed clay, mud, gravel & boulders
but all these seem to be wash from
streams or gullies coming down
mountain side & was or less strat.
on slope. About the Loop on Michel
Ck. extensive 'sumbo' cuts in strat
clays or silty clays of brown
colour. May these represent glacial
mud deposited when Cordilleran
glacier blocked mouth of Michel Ck.
etc & water discharged E. over
summit of Crow Nest Pass? Much
gravel in places & at head of loop
 in cuts in terrace about
100' feet above pt. X on
trap track, see sumbo distinctly
resting on & passing down into
beds of clayey well rounded gravels.
(Compare with similar sumbo on
Kicking Horse.)

The first thing I noticed
 when I stepped out of the
 plane was the fresh air.
 It felt like I had been
 in a cocoon for weeks.
 The sun was shining
 brightly, and the birds
 were chirping happily.
 I took a deep breath
 and smiled. This was
 my chance to start
 over. I had finally
 found a place where
 I could be myself.
 The people here were
 so friendly and kind.
 They welcomed me with
 open arms. I felt like
 I had found a new
 home. I was finally
 where I belonged.

Except points of inwash, as above described, all the gravel etc seen along Elk Valley may be attributed to river action. River gravel plains & terraces etc. In this probably agrees with other large low rivers in the Mts., the Columbia eg.

Leave Macleod 7 P.m. for Lethbridge, arriving 9.30 P.m.

Sept. 8. To cut banks showing boulder-clays & Pierre shales at Lower end Alexander's bottom, about 3 miles from town. Set specimens of clays. Photo. & photos, of No. 3. Pit of coal mine, view the working pit.

Sept. 9. Examine cut banks near the town & collect specimen of clay. Train for Medicine Hat.

Sept. 10. Arrive Medicine Hat & go on Eastward.

Sept. 11. Travelling East.

" 12. " "

" 13. Arrive in Ottawa.

I have been thinking of you
 and wondering how you are
 getting on. I hope you are
 well and happy. I have been
 very busy lately but I will
 try to write to you more
 often. I love you very much
 and miss you every day.

Journey to Nova Scotia,

Sept. 24. Leave Ottawa 3:50 P.M.

Sept. 25. Sunday, at Montreal.

Leave by C.P.R. evening train
for Truro

Sept. 26. Arrive Truro this eve.

Sept. 27. Call on Ami, who
has been ill, will be able to
leave here tomorrow.

Sept. 28. Truro to Conductor Junction
& thence to Wolfville, arriving
6:30 P.M.

Sept. 29. Drove with Ami this
am. to Angus Brook, running
into Gasperaux River from South
Mountain, spent some hours
up the brook examining section
found there by Ami. In P.M.
drove to Blue Beach, about 9
miles, beyond Horton Lighthouse
& within $1\frac{1}{2}$ miles of Hautepont
Examined shore section here till
sunset & then back.

[Faint, illegible handwriting on a grid background, likely bleed-through from the reverse side of the page.]

Lower part of Augas Brook shows
typical Harton rocks, sandstones,
thin flabby, shales, sometimes black
- a certain small percentage of
reddish rocks throughout. These dip
down the brook regularly at low
angle a month several hundred
feet thick. Below them ^{is} grey soft
arkose sandstones & conglomerates,
evidently chiefly granitic material,
quartz, decussate felspar, some-
times micaceous dark grey or
reddish stony sandstones. Pebbles
chiefly quartz, fairly rounded. Some
of underlying Silurian slaty rocks.
These are conformable with the typical
Harton & evidently a part of the
same series. Month at least 50'
thick, perhaps nearly double that.
They rest directly on fine grey, greenish
& pale reddish Silurian slates
dipping at higher angle in opposite
direction. Distinct unconformity.
Cami states that the arkose beds
are the same with those at Wickham's

[Faint, illegible handwriting on a grid background, likely bleed-through from the reverse side of the page.]

quarry at Looperville which have
been spoken of as Triassic.)

Blue beach reached by a steep narrow
road that runs down along a
gully & stream. To the west of this
stream a regular ascending
series in the cliffs dipping about
30° for about half a mile. Exposure
almost continuous. Meet a small
fault, making apparently an upthrow
of 20 or 30 feet & undulation of
dip, but similar rocks continued
beyond in the point. Beds generally
resemble those of Angus Brook
above arkose sandstones, but fines
framed & darker. Were fine blackish
shales, less sandstone beds &
numerous calcareous bands
of a few inches or feet in thickness.
The whole typical Harton.

Along shore in opposite direction
from the brook, no section for nearly
1/4 mile, then grey & dark fleecy
sandy & shaly beds like those

above described, but with much less shale, dipping at very high angles, but in the same direction. Then broken & wanted rocks for a few feet & then red shaly & sandy beds with much lower dips in a similar direction. These contain ~~at~~ ^{at least} two strong beds 10' or + & 20' or so of soft grey arkose grit & conglom. exactly like that seen on Angus Brook. Had not time to go beyond the point, but am sure that considerable thicknesses of red beds seen there in descending series. These red beds are softer than those of Union series in Pictou Co & at Lewis, but might very well become exactly the same by slight additional weathering, crusting & slickensiding. No fossils have yet been found in them at this place.

Although the above section is not continuous can be very little doubt that it is practically so

& that the red beds would be found
in same relation to Arkose Sandstone,
on Angus Brook but no progressive
overlap in that direction on the
older rocks. Here we a good clue
here to the relations of the Harton
& Union?

Oct. 1. Detained in Woolville reading
batch of proxy which at length
arrived.

Oct. 2. Woolville to Kettlewell,
Kingsfart & across by steamer
to Parrsborough pier. Spent most
of Am. at the point near pier &
behind Partridge Island. Then to
Parrsborough town a drive thence
to Brodricks at Five Islands.

The west side of the point behind
Partridge Island shows perhaps a
thousand feet or more of beds which
are assigned to the 'Union' group of
Fletcher or about the junction of that
with the underlying ^{Blackheath} ~~Winnisdale~~ series.
Greenish, grey, & red which are red.

[Faint, illegible handwriting on a grid background]

beds with very high & uniform
Southward dip. Sandstones, shales
& occasional beds of fine calcareous
conglomerate. The reddish beds may
form about a third of the whole &
occur at intervals throughout. All
very regularly & thick bedded &
nearly every surface well ripple-marked
& this often finely displayed in larger
faces. Found arthropods, *Leisia*, *Estheria*,
Naidites & large reptilian tracks,
several inches across.

These beds overlain to the north by
reddish calcareous conglomerates,
somewhat softer & more massive
& dipping at an angle of about 30°
in a northerly direction. The uncon-
formity was distinct & convincing,
although cut-off edges of the lower
beds show a slight tendency to the
Southward as if subsequent thrust
in that direction had occurred. The
newer conglomerates hold pebbles
of the underlying series, including
fragments from the peculiar fine

Length about 40', at base of cliff & broken
trunk about 50' high.

Sketch of actual contact N. of Portage St.

Colcareous congloms. of that series
above alluded to. Also granite or
syenitic pebbles & others of
varied origin. After a small local
twist these upper congloms. are
followed in ascending order
by grey Carb. limestones with
characteristic fossils & in these
are narrow beds of reddish
conglomerate intercalated like
those seen at base of this formation
& evidencing the unity of the whole.
Also some greyish & reddish
argillite beds, rather soft.

In the reddish congloms. of the Carb.
limestone series are some fragments
of grey limestone, apparently showing
that some of these limestones had
already consolidated & were
being broken up nearly contemporaneously
with their formation. This does not
seem to be very uncommon in the
case of limestones, at least I have
seen it elsewhere.

The large reptilian tracks above

[Faint, illegible handwriting on a grid background]

seem to show that the underlying series cannot be placed lower than the Carboniferous.

Oct. 2. Sunday. At Brodricks, Five Islands.

Oct. 3. Spent the day on Harrington River, examining section & collecting with Ami, who has measured section along the river.

Excellent & nearly continuous section of rocks correlated lithologically & by fossils with the Riversdale Series, about a mile in length at an average \angle dip of about 60° to the Southward, giving probably 3000 feet in thickness of strata. This counts from the furthest south exposure of intrusive rocks, down stream as far as the section continues regular, or to the old mill dam a short distance above the crossing of the

post road. This part of section
consists of shales, sandstones &
rocks of intermediate texture, grey to
blackish in colour. Sandstones often
quite hard. Shales sometimes very soft,
fine, block & crumbling. Frequent
alternations & 2 or particularly well
varied throughout. Fossils at frequent
intervals & occasionally quite
abundant, but save Conioidella
shaly bands & nearly all the sandstones
nearly barren. No red rocks whatever
& therefore probably lower in the series
than the rocks seen near Partridge J.
One crook tree about 6 inches
diameter & say 10' long seen, but
not well enough preserved to
determine.

Stratigraphically below these rocks &
further up the river, for about $\frac{3}{4}$ m.
nearly half the section is made up
of igneous & intrusive rocks, reddish
& quartzite-like, felsite & probably some
diabase. Between these & Conioidella

The first of these is the
 fact that the world is
 not a uniform whole
 but a collection of
 parts which are
 constantly changing
 and moving about
 in all directions.
 This is the case with
 the human mind as
 well as with the
 material world.
 The human mind is
 not a static entity
 but a dynamic one
 which is constantly
 being shaped and
 reshaped by the
 environment.
 This is why we
 find that the
 human mind is
 so plastic and
 so susceptible
 to suggestion.
 It is this quality
 of the human mind
 which makes it
 so valuable a
 tool for the
 study of the
 world around us.
 It is this quality
 which makes it
 so difficult to
 teach and so
 difficult to learn.
 The human mind
 is not a machine
 which can be
 programmed to
 do a certain
 job. It is a
 living organism
 which grows and
 develops over
 time. It is this
 quality which
 makes it so
 interesting and
 so challenging
 to study.

disturbed by them are much
hardened & spotted sandstones
or quartzites, argillites & rocks of
intermediate texture, often breaking
with difficulty along the bedding
planes & occasionally containing
some talcose or chloritic material
along these planes. The igneous rocks
often follow bedding planes roughly,
but are evidently subsequent
intrusives.

In this Test series of hardened
rocks can find no fossils whatever,
plant or animal, while the intrusives
do not anywhere appear in the
fossiliferous section to the Southward.

Fletcher considers, & says, the
hard series associated with the
intrusives as altered parts of the
fossiliferous series, or Ruessdale.

It may be that intrusives alone
have hardened these rocks, but
the complete exclusion of intrusives
from the fossiliferous series, raises
the question whether the hard rocks

[Faint, illegible handwriting on grid paper]

may not really be an older series, penetrated by intrusions before the fossiliferous Rivisoldo series was laid down. Other sections, however, may bear out the interpretation that Fletcher appears to give them on his maps.

Oct. 4. Drove from Lower Five Islands (Broderick's) to Londonderry & got train to Inuro, arriving in the evening. Read folios 12-24 of Colverson's report map, which I found here.

Oct. 5: By train to Union Station & spent day with Ann carefully examining the magnificent section of 'Union' red rocks between that station & Valley Station. An almost uninterrupted descending series several thousand feet thick. Hard greyish & red-weathering or reddish sandstones, sandy shales & crumbling fine argillites in repeated alternations. Almost exclusively red or reddish in colour with only a few small grey or greenish-grey bands.

Very soon below
of *Stenocentrus*
Tadpoles.
Very small.

Lucina
Bat holes.

heavily barren of organic remains.
A few unrecognizable impressions of
plants, small worm tracks or burrows
here & there, making up the list, although
beds very carefully examined. In one or
two places obscure impressions of
trunks or branches several inches in
diameter, but impossible to tell what of.
About a mile before reaching Valley,
on opposite side of Salmon R., cliff
with fine display of unconformity
between the Union beds & the Triassic.
Exposed a couple of plates on this,
although light very poor at the
time.

The Union rocks (as Truro Series as
Ami suggests they might be called)
appear to me closely like the red beds
below Harton Series at Blue beach
in litho. character, although without
the peculiar arkose sandstone bands
there locally developed.

The first thing I noticed
 when I stepped out of the
 car was the smell of
 fresh air. It was a
 relief after being stuck
 in traffic for hours.
 The sun was shining
 brightly, and the birds
 were singing. I felt
 like I had been reborn.
 I took a deep breath
 and smiled. Life was
 good.

Oct. 6. By train to Winnipeg
this morning. Hence by stage to
McAra's Brook, 14 miles.

Oct. 7. Spend greater part of the day
on McAra's Brook. Examined &
collected in beds near the bridge at the
road-crossing. Then descended the
brook to the shore & had a look at
some of the shore sections.

The beds near the road are red or
reddish, sandstones & shales, with
some grey or bluish sandstones. Really
hard & generally not at all unlike the
Union beds seen on the 6th. They
hold, however, one or two narrow
Calcareous zones with stony pebbles
& fish remains which are regarded
by Woodward as probably uppermost
Silurian. In going down the brook
the section is generally descending
& Carbonaceous plant fragments
are found in some beds, but quite
undeterminable. The section is
interrupted for a short distance near

[Faint, illegible handwriting on a grid background, likely bleed-through from the reverse side of the page.]

& at the mouth of the brook, by Lower Carboniferous beds, unconformably overlain, but is resumed, a short distance to the east of the brook, by well characterized Silurian beds, with marine fossils numerous, & forming the upper part of the faunas arising Silurian section. These beds agree very well in strike & dip with those first seen on the brook, & I can see no reason to suppose that there is any unconformity between the beds at the two places. The lighter Silurian beds of the main blue section are partly reddish or red in colour, although mostly greyish. If the beds at the two places are really conformable & parts of a single series, as appears altogether probable, there must have been a change in conditions, from open sea with numerous molluscs, to circumstances inimical to marine life, the fauna consisting of the above-mentioned fish remains only.

[Faint, illegible handwriting on a grid background]

The covering rocks which interrupt
the section, consist of soft red Sandstones
& Conglomerates with intercalated
traps. There seem to me to be evidently
contemporaneous & to be very well
represented by the section given in
Alacadian geology. The trap bed to
the west of the brook is frothy & very
amygdaloidal at the top & the
Conglomerate (reddish) underlying it is
full of decomposed fragments of
this frothy amygdaloid, evidently
broken off shortly after it had
consolidated. At the brook, reddish
Sandstone material is seen to fill
nearly vertical joints in the traps,
having evidently been introduced
from above when these were open.
Two underlying traps seem very
much to respect the conditions described,
but one of them is quite small, &
seems to be a narrow contemporaneous
flow. The conditions in regard to
these are not, however, quite so clear

Senonian? seen at the
 base of the Sydney &
Wentworth Permian.

 beds of fossils.

Lower East, Dalry, sandstone
 & conglomerates.

The Section.

Wentworth East.

Plan.

as those in the first case.

The character of these traps is not such as to indicate that they may have disturbed the unconformably underlying beds at all. The point or points of eruption may have been quite distant from the positions the overflow now occupy. I had previously supposed that the trap was an eruptive boss breaking up here through the lower rocks & very probably indicating a real hiatus in the section.

Oct. 8. Drove back to Merigonville this Am. Train to Truro & there got S.C.R. train for Montreal.

Oct. 9. Arrived at Montreal about 1 1/2 hours late. Lost connection to Ottawa, but proceeded by 10 Am. train.

Oct. 10. Reached Ottawa about 1.40 Am.
