DAMAGE TO BOOKS

Readers are reminded that under the provisions of the Canadian Criminal Code any wilful damage to property constitutes a criminal offence for which severe penalties can be inflicted.

Minor damages render the offender liable to a fine of $20.00, and he is also bound to compensate the owner up to a limit of $20.00. Refusal to pay these sums is punished with imprisonment up to two months. (Sections 539-540).

More serious damage can be visited with a term of imprisonment up to two years. (Section 510-E).

Examination of a dozen females, variously affected with Laryngeal disease, in the Marylebone Infirmary - including an attempt to do so on 2 Idiots -

March 21st 1883. I went by appointment to the Marylebone Infirmary at ¼ past 3 pm, to meet Dr Randall, and examined about a dozen cases of laryngeal disease, chiefly mild -

Case of aphonia 14 months standing, in a woman of 40, who has had it off & on for 14 years - Has chest disease as well - Larynx & epiglottis red & congested, cords normal, trachea inflamed, & subglottic swelling -

General Paralysis with paraplegia in many ways - elderly woman - was so nervous, agitated & excited, could only see the epiglottis - Tongue spasmodically retracted -

Dumb idiotic girls about 13 & 14 - No intelligence - could not get the tongues out, & when the Mirror was introduced into 1, she nearly bit the handle in 2 -

3 or 4 cases of mild Syphilitic laryngitis, well seen, but nothing out of the way -

One patient, an intelligent person of 19 or 20, trembled most violently, but I had a capital view of the larynx & could have seen the bifurcation with a good light -

Dr Randall & his assistant have the cases well -

An elderly woman with partial aphasia, pernicious laryngitis, had swelling of the membrane beneath the left vocal cord, which projected beneath it, as if a third cord was present, thus:

Mrs Thomas Abraham aged about 60 of Hampstead. Heath (Squires Mount) Came to me March 23. 1863
with Mrs Harrison, wife of the Surgeon of 6 Upper Montague St, W.
& recommended to me by him - Ill with sore throat since 16 Dec 1861
caught at Hampstead, have badly drained, diphtheria then prevalent -
Under Jenner, sometime, who applied sol 50 times (every 2nd day) &
the sore ulcers did good to back of the throat - In swallowing has
pain at the root of the neck, top of sternum, which she thinks
is the disease & has driven downwards - Slightest cold flies to the
throat; has suffocation fits at night, always, as if going to be
Choked - & as if each night was to be her last - Is nervous & excited
& anything affects her, has had much trouble - Has soreness 1st on one
side & then on the other - Health low & weak, taking quinine bitters
& using gargles of Iron, tinct quinine black - The fauces looked well.
Laryngoscopy - showed Chronic congestion of Trachea & sub glottic
mucous. mem with great irritability & spasm of all the muscles
of the larynx - Latter much manifested during exam^n - Cords nat-
ural & small thus  C. mag. bis. die -

Mr Alex Strachan, act 36 - Came to me March 23. 1863 with Dr H. H. Adam of 57 Cumna St Road E.C.

Had sore throat since age of 16, but more frequent for last 6 & especially last 2 mths. Has constant hemming as if anxious to clear the throat. General health good; has been much in warm climates. No dysphagia nor dyspnoea - no pain at all - 3 or 4 times ill with fever of the country he visited - Voice now affected, no hoarseness nor other trouble - Lar) showed general vivid redness of epiglottis, larynx, traches & subglottic region, with some tumefaction of M. M. in anterior part of the latter - edges of epiglottis thin & irregular not the plump appearance of health -

Applied sol nit arg twice with a brush with out the mirror as time was past 12 o/ of the forenoon. & with the Mirror I showed Dr Day the whitened membrane & this in the larynx after -

I made him use a gargle of Bromide, which lessened the irritation somewhat. Dr Day had a consultation with the Laryngoscope but not satisfactorily -

Chronic laryngitis, with hoarseness, and then aphonia; phlebectasis laryngea associated with

John Hitchins aged 33, from Cornwall, March 28th 1863 - sent me by Dr Symes Thompson, under whom had been at Hosp for Consumption. Attack of Bronchitis 6 years ago, and 3 years ago hoarseness commenced, and has gradually got worse, until his voice became extinguished. Six months ago he spoke in whisper. Coughs in the mornings & spits much phlegm - No pain, nor dysph nor dyspnoea; breath rather short. Has resided in England all his life, although a Sailor - His hoarseness came on in hot weather; is a stout man - & has passed 6 mos without advice - When the voice went away 6 mos ago, it did suddenly, but it came & went for a short time in doors, but not out of doors. Now it is a constrained hoarse whisper. 12 mos ago could not swallow fluids without pain -

Laryng. Throat very irritable - M.M. very red & inflamed - Vocal cords, or if seen they were red; trachea & larynx also red & inflamed.

Sample in ℞ -

18th He wrote to say his voice was weaker than ever it was
since his return to Cornwall, but cough troublesome -
Omit Aconite - Pt Pectoral mixt in my answer of 26th

Sept 9th - He came up at my suggestion, to have Local galvan^n to the cords - Health better, gained 6 lbs since last visit. Cords red with pissure in right; voice more: generally red with some follic disease of fauces & irritability - R Iron Nit 3ij / Glycerine 3ij / Water ad 3vij. Gargle m.d.e.

Elect Galv 5 times direct.

11th With sunlight saw portions of the cords, & rings of the trachea - Elect Galv direct to cords & anterior with aid of mirror, several times, & also thro the neck - found the gargle very good, the tongue remaining rough a short time after.

14th Can forcibly utter a low guttural sound -

Elect Galv as before to cords & neck - Shower Douche -

16th Inhalation of Tannin & Elect Galv to outside of neck - Exam^n with sunlight convinced me that the true cords are all gone, & it is the false ones only that project & meet thus - Prognosis is therefore bad -

18th Elect Galv to cords & neck - Sol Tannin to larynx -

21st Do - Exam^d chest - some thickening of tubes in left upper -

23rd Exam^n only - no application - whisper stronger -

25th Do with sunlight - Sieveking wrote me he had found the "Vocal cords much thickened, very red, and at their anterior portions, extensively eroded by ulceration." Told him his recovery of speech would be one of time -

26th Shower Nit arg - 28th Shower Douche & R of Pectoral Mixture -

29th He leaves for home C. M. & I advised him to remain

quiet for some months without any special treatment beyond the Red Mix - & to exercise the utterance of sounds -

Treated in Ecd 2

16 Case of supposed Tumour of the Larynx, where there was inflammation of the Larynx & trachea, and thickening of the membrane below the left vocal cord.

On 30 March 1862 Mr James R. Lane brought 2 medical gentlemen from ~~Bath~~ Leamington, one Mr T. Ebbage with a female aged about 34, who they said had a growth in the Larynx which they had seen, & my opinion was wanted. She had been ill with sore throat a few months only, voice never gone away, & she was not hoarse. — in fact beautifully so — Larynx was easy, and the cords were clear & white & unaffected. No growth was visible whatever, as I showed them all, there was a little prominent thickening of the M. M. below the left vocal cord, which in some views was on a level with the edge of the cord itself. There was intense inflam[n] of the Larynx & trachea, & parts of the fauces. I applied a Sol of Tannin & showed them the brush onto the Larynx with the mirror, followed by no spasm whatever, which they were struck with. I suggested a gargle of Borax, Al, Gly & H2O. & a mixture containing a little of the Ist.

Not being familiar with the use of the Laryngoscope, a mistake had been made in taking some prominence of the throat itself for a tumour; but the view was unobstructed right far down the trachea. I showed them my own Vocal cords —

A cluster of small growths (warty) at the posterior part of the sub glottis, not interfering with the action of the cords, with occasional aphonia, & constant unconscious catch of the breath - Removal with the ecraseur -

Lydia Crouch aged 16, 2 Marshars Road North Blythe Lane - 31 March 1863
brought to me by her mother from Hammersmith. She speaks as if she had a cold, with a sort of catch in the voice & thickness, a sort of dyspnoeic sound -
which induced me to examine her -

Six years ago had a swelling of the stomach as if dropsical; this went away; health is generally delicate, looks pale & anxious small & thin & is short for her age, never feels well at her meals - Bowels generally relaxed, has pain in her side - Motions dreadful odour & undigested mixture of all sorts & colours, never solid - No menstruation as yet - Subject to great deal of wind which is belched with loud noises, sighs a good deal - Groans & mutters in the fire. Neck very thin - Fine child up to 6 years old - Larynx well shape - A cluster of small growths, greyish white, more easily seen, at posterior part of the sub glottic region, below the cords, as seen in the 2 figures - Her voice is at times reduced to a whisper, of which they are the cause - Never subject to sore throat - Larynx was otherwise normal - Removed them with the assistance of Dr Sayers & Mr Sturges. 7 April Showed her to Dr Wm Tindall Robertson of Nottingham - The growth was not so projecting - On 6th I endued her at

Chronic follicular inflammation of larynx & trachea;
General ulceration of entire nose: mem:; elongation of uvula-

Mr Hensby, a wealthy farmer of Suffolk, 31 March 1863
came to me from Mr F. H. Harris, Surgeon, of Mildenhall, Suffolk.
under whom he had been for laryngeal disease for sometime. Has
been also under Mr Rasking of Norwich & Mr Image of Bury in con-
junction with him, without relief to the symptoms, which he states
mainly consisted of loss of Voice. General health very good -
No syphilitic history & habits regular -
History unimportant. Voice altered for a year & a half, com-
mencing with cold; health good before & so now. Cannot sing
nor read aloud; out of doors can be heard - Voice is thick &
hoarse, with an occasional fine tone, like the double voice -
Throat very dry in mornings on waking - Voice never a whisper.
No dysphagia nor dyspnoea - No pain whatever. Lungs sound -
Is stout & well developed - with streaks of depression.
Larynx will borne - General relax^n of entire mucous mem - &
elongation & relaxation of uvula, thick deposit in pharynx back of nebum -
Larynx & trachea much congested. Cords normal in size & colour
partly covered, acted well, closed firmly - Sub glottic folds on
each side looser than natural - No growth in the larynx of any
kind - applied brush wt Tannin to larynx & also to pharynx -

Wrote in accordance with above Mr Harris on 1st April –

~~Died 2nd His wife Hers~~

Hemorrhage from the larynx, from Syphilitic dyscrasia.
Inflammation of larynx -

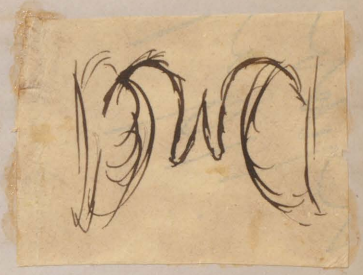
Mrs Marshall, aet 36, a tradesman's wife, on April 2. 1863 was brought to me by Dr Ballard 10 Southwick Pl, Hyde Park. In Nov 62, husband had an Hunterian Chancre, treated by Calomel baths, &c. At X mas his wife had neuralgia capitis, agonizing pain; Quin, Fer &c no benefit. After well marked Eczema appeared - She had Calomel baths (16) & it went away - Throat then became sore - To day, Am, in brushing her teeth, the mouth filled with blood 3 times, & about 3 teaspoonfuls of florid colour were spit out. No cough at all - little dysphagia - Voice at first illness, at times affected - not now, tis pure & clear - hot & cold drinks hurt throat. Laryng showed general vivid redness of larynx, cords pale, & trachea; in the mus mem above the left vocal cord was some breach of surface, very red, & no doubt the spot whence the blood had come from. It corresponded too, to pain on left side of Thyroid Cartilage externally. Besides Dr Ballards own treatment of blue pill &c I prescribed a gargle of Brandy ℥ss ad ℥j
Glycerine ℥ss Aq ℥vi - to be used

Tongue spotted from the eruption - & advised a saline aperient to follow -

Quoted in Ed 2

24 Split Uvula, congenital -

Mrs Gardner act 53, came to me Nov 2. 1863
from Dr Wright with a note -
She has had sore throat 3 weeks & was under him
at the Samaritan. She is nearly
well, but the sketch shows her
bifid uvula - with enlarged
tonsils - I found the larynx to
be quite normal -



Referred to Ed L

Examination of Paralytic patients.

April 1st 1862. At the Hasp for the Paralysed I examined a woman, who was recovering from an attack of Hemiplegia of left side, & found the left arytæno-epiglottic fold partially affected as well as the left cord, although speech was tolerably fair - Dr Jackson's patient.

A Boy wh Anamnesis, had his epiglottis partly pendent, & twisted towards the right side - ditto -

Ossification of the larynx, gouty inflammation, tracheotomy, etc

Continued from page 453.

Rev Ed. R. Nares - I visited him at Wittersham on June 11th 1864 and he went to church, as well as on the previous Sunday. He was better in every way, and on examination, the glottis was found to be more expanded and if holes are made in the cannulae, I think speech will gradually return -

12th In addition for soreness of throat

30th I visited him again at Wittersham & had a good view of the larynx. The glottis was open, but little air passed from below upwards, & I suggested holes being made in the tubes to ventilate this. His voice was not strong, but he was much stouter - I wrote him on August 3rd about various matters -

25th The new perforated gilt tube he sent C. M - Had not been so well - Appetite failing, breathing bad, weaker &c -

Aug 28. He wrote that the new tube, larger than the other was got in by Mr Terry, & he could breathe a little thro the mouth.

Oct 6. He writes what he has to say, for his finger on the tube to speak, causes soreness & occasional bleeding. The fact is he does

Mrs Berry
27 Shaftesbury Terrace
Pimlico Station

not manage it properly, as I wrote to him on the 6th - & I suggested what he must do, in using the left hand. He was depressed, weak & pained -

Novem 19 arrived in Town yesterday & is staying with Lady Churchill Soaks well & has been free from gout. The wound is sore because the hole in cannulae is stopped up by granulations or cartilage, so that not little air passes upwards. They bleed freely on touching such a probe.

Lazy removed a narrow sequestrum, with some swelling of left side of larynx in neighbourhood of it, epiglottis & V.C. of a pale pink - Voice thus The obstruction is clearly in the subglottis probably a growth.

20th was easier & no bleeding, to day I feel passed but any upwards & no bleeding - Larynx case better same -

22nd push of blood around, at insignificant in speech, which was loud at times - wound looked cleaner in the hole of the tube above. 24th was low spirited but otherwise well - passed a wax & after a solid curved flexible metal bougie upwards - following by bleeding - & ointments used the canula - improving. Thom and Zn -

26th Discharge more acrid & excoriated skin of neck - Fauces little coagulated better in the whole - Voice is better & opening clear - Ung Zinci Zss to neck - Sol Iod ag to fauces & epiglottis -

28th Still much soreness outside, on the malous. but voice is stronger - Took out the main tube & found the opening leading upwards very small, thus thus , it ought to be so I commenced to destroy a band of granulation in front.

30th Voice is nearly as strong as when I last saw him in the country. Is better on the whole - Piece of flesh he says he expected 2 hours after he saw me, like . Most tissue is destroyed & I passed a larger bougie, of wax, upwards, & no bleeding after it - Sol Iod ag to fauces.

Dec 2 Depressed & gouty to day, as the otherwise very much better. Fauces sore - opening in canula seen clear - reapplied nit arg, & Sol Iod ag to Fauces - added to mixt Gll Am and Zij To go on with his mixture -

5th He spoke better & larger than the mouth than I had heard him & with less inconvenience on putting finger to tube - Felt he was very gouty but better than last day - Not any solid as before. & Sol Iod ag to F.

8th about the same. Ft omnia -

12th Last day passed another little fragment of assisted ring - The opening was clear to day & I repeated the same treat. but as he had

28 had some diarrhœa, I stopped his meat. & put him on Liq Ammon Zi to Zi ex aquæ as he had no appetite.

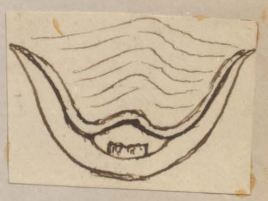
Anaemia of the larynx, associated with a growth at its posterior part, above the cords, in an anaemic young man -

Mr Cowne, a very anaemic & thin young man, aet 22, I examined on April 4th at Mr Walter Coulsons house, 26 St James Place, St James Square, S.W. He lives in Portland St, & had been ill 6 months - White the dark eyebrows & hair & the thin pale & delicate features, he looked like a wax model - Has much improved under Mr Coulson - Has a little catch in the breath, but no actual sore throat, altho he has been a little hoarse at times, but not aphonic -

Larynx showed a little growth passing from right to left across the back of the larynx, above the cords, so ▭, like the back of a small comb. The epiglottis was very much pendent & looked warm & curved, and it was only by sudden inspiration that the interior of the larynx could be seen. The cords were normal, rather narrow, & the surrounding mucous mem in larynx & trachea, perfectly bloodless, nearly as white as the cords. The absence of redness was quite remarkable - The growth is small & narrow & is not prominent; in some views it is a little more irregular, thus ▭ ▭ ▭. I advised the use of the Bromide of Iron in 3gr doses - No manifest syphilis nor other malady -



30 **The Revd E. R Sales** continued from p 28

1865
Feb 3 much better in every way, ordered to omit the tonic. Sol Cannin
6 fauces - Uvula relaxed - stronger & looks better —
6th Took out both tubes & found a sore spot only under ponum, from which probably some more cartilage may escape - To swallow my usual draughts, few drops at a time - ordered air to T & L.
7th Exhibited fragments of ossified rings before Path. Soc.
10th Mr Balthouse saw him & agreed with me as to their being some necrosed cartilage to come away for the front beneath the ponum - Applied Solid Nit Arg, to the part opening & free bleeding followed —
13th Salivated for 2 min & 2 od pot - Omit Om. & use Mint tea - Applied Nit Arg to opening as before - & he was measured for a new tube -
16th Heartburn & retching were so severe that I had to prescribe Hydrocyanic & Soda Mixt, & to regulate his diet, stoops arrow, carrol jelly & bare, cheese &c. & I found him better on 17th - A wash of Myr & Tr of Cinchona formerly was also beneficial -
19th altho better, I added Nit Bismuth to his mixt - in 10 gr doses -
21st much pain in neck & around tube & persisted Sol warm Water —
examd Miss Nares throat
23rd Monday fine March - Put in new Silver tube, & applied Nit Arg to side of wound.
25th 1½ grs Pil Opii in Mane & n. P. Nit Arg to sides of wound -
27th Generally much improved but soreness around the tube —
March 1 Better in every way, but irritable - 3i ad 3vj.
3rd offensive odour of dead cartilage & some pelt expelled - Sol Pot Permanganate
5th Some swelling of trachea at end of tube, which prevents it being pushed home. It obstructs the breathing - Probably from the irritation of retching —
7th Some streaks, from excretion in trachea, chiefly tinged blood & mucus. This I removed on taking out the tube - but there is clear & probable exposure of the ossified cartilages, for I felt them rough with a curved wire.
9th Breathing much, but still much accretion & soreness - p 80 rather weak - Sol Nit Arg.
10th Much better, less obstruction, shower Nit Arg, with no discomfort - Took Mixt last night & P. pulse stronger.
11th Slept well & much better - repeated argental shower to trachea, & mucus felt
13th Bad night, no sleep, but well otherwise., Anoint of myr ×× Blk drop -
15th Dad had much pain - Trachea contracting & healing, but rings denuded - Ordered
16th Saw him with Mr Terry & explained the nature of his case - Has hard pain in right side, corresponding to right bronchus -
17th Much better but there has been severe retching —

Continued at page 57.

Miss S Aylward, act about 44, came to me 13 April 1863
with Dr Tilbury Fox. Lives at Andover.
Her voice has been gone for 2 years & more, and has
been a whisper; at first the whisper was inaudible.
Commenced with a violent cough. Latterly had hae-
moptysis after violent coughing, but it has within a few
days appeared without cough. Yet she has a little cough
now. No dyspnoea nor dysphagia. Has pain in the
right side of the neck.

Larynx shewed swelling of the mucous mem.
above the right vocal cord. but the
examination was not satisfactory, on account of her resis-
tance from nervousness.

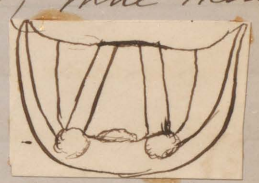
Laryngismus Stridulus and cough in a girl with Hysteria -

Frances Baring aet 23, Single, came to me 13 April 1863 from Mr Solomon Sharman of Somerstorward, Surgeon - She lives at Clehonwell - Always in weak & delicate health - 6 years ago the throat became affected with dry irritation & cough - after sleeping in a damp room - has been hoarse at times but never lost her voice - Cough has been sometimes very bad, no expectoration. 15 mos ago, a peculiar noise commenced on inspiration accompanied with dyspnoea, which has been constant ever since; has often been frequently hyst relief - Catamenia regular - Became very thin lately, a needlewoman & has not had everything she could wish - No cause for complaint she is aware of - Throat sometimes sore but never any dysphagia with fluids or solids - Has constant pain all over the front of the neck, shooting through the throat in different directions; sometimes earache, but never deaf; is quiet when asleep, sometimes starts at night from the pain - Has been under various treatment for 6 years - E. L. frequently - under Mr Sharman since 14 Oct 62.

Present symptoms. a dry semi-stridulous inspiratory

sound, with almost constant hemming; voice is a peculiar hoarse squeak - Can speak perfectly well, but is sometimes very hoarse - The stridor has a peculiar crowing sound; is very nervous & low spirited.; feels all the time as if she should be choked, day & night, & as if there was something in the throat. Breathing worse indoors than out. Has a difficulty in filling the chest with air.

Larynx easy. Arytenoid cartilages small & round, mucous mem of larynx red & inflamed, but everything nearly normal; cords white as glottis lay open, but streaked with longitudinal redness during the utterance of sounds, with small triangular space behind, as in fig 2. A little, pimples seem to be at posterior surface of larynx between 2 cords above, but would not say positively it was a pimple - Yet the voice was good with all this - Larynx touched down for some distance -



℞ Am Bromid 3iss
Aq Am anis 3iij
Syrup 3ss
Aquam ad 3viij -
C. mag. t. d -

Applied Sol Tannin to the larynx -

18th Came with her mother, who says she is at times very hysterical - The stridor is less, & she has none in her sleep usually - Larynx showed nothing. Shower bit aq. pt Tinct.

23rd. Admitted ~~with~~ 23rd the West London Hospital, & she seemed better. I prescribed —

Sol Br am 3ss in Glycerm to the cords locally —

am Bromid grs iv
Spt am aromat ♏ xx
Aq Menthae ℥ss t.d.

27th Last night she had one of her dreadful suffocative attacks, that almost called for Tracheotomy — Ether was used & relieved. To day the breathing is much quieter — Bromide to be grs vj

4th May. Breathing is better & the noise much diminished altho she had had many suffocative attacks at night. The chem is less frequent, but the hiccups of this day much resemble several days ago had, & so loud at night that they were heard all over the house. Sleeps a little in the morning —

Bromide to be grs viij. Ether ♏ xv & aq menth t. Sits up a little & has been moved to a warmer room.

11th Was free from sticker & hemming altogether.

18th Sleeps free from noise & is well of the laryngismus, but has an exceptionally smelling offside & sour from cured bowel & Rx Ferr Mur ♏ x Liq Opium ♏ x ~~ex~~ 21st ♏ xv ex Aq Menth t.

21st Face better, but sickness & vomiting of food is persistent now & then — ordered Rx Cocaine (7 drops) to be painted along the course of the pneumogastrics — Sleeps quite quiet now & is free from laryngismus during the day — Rx bis —

Impaired nervous power of the muscles of the larynx and tongue, with imperfect thoracic expansion -

Master Frank Webb aged 5, brought home April 24th 1863 by his parents from Henley on Thames, with the card of their A. D'Oyley Brooks, Surgeon, of that place. Never strong, 3 years old had a Convulsion, preceded by Eczema - Had impediment in his speech before this, but it was worse afterward. Is otherwise very intelligent - Never had Scarlatina, Rubeola or Pertussis. His brothers & sisters are well in every respect & speak well. Many of the Consonants he can pronounce, but not the terminations of syllables - his talking therefore is like a young child learning to speak - Vowels can say - b. m. d can say - but him he calls bim, shaw for saw, doad for goad; if in bad health he is worse - Not tongue tied -

Lungs, well borne - The cords approximate, but sluggishly, as if the chest was exhausted beforehand - The arytenoid muscles probably have much to do with this - & thereforeElectricity would be good, & also Bromine & Strychnine.

Epiglottis is a little pendant & carewarn

Prognosis given hopeful, in course of time, much depending upon moral influence at home, in learning him

to fill the chest before speaking & especially in pronouncing particular words -

c. med ter die

1865
July 17. Has grown a fine boy & much improved in every way. As he had had convulsions 3 or 4 times, Mr Brookes told me he used to galvanism. Nor did he take any Nux Vom - Very excitable & nervous & then his voice stops & he stutters. Goes to School Gen! health excellent. Larynx shows the larynx quite normal, & action of the muscles stronger & better. No need is necessary - In time he will quite recover all his Vocal powers if his hearing is not injured - Speaks pretty well now - is 7yrs of age -

1871
January 20 She (the Mother) wrote me she must bring him up, as time had not done for his speech what we had hoped, & I saw both to day. He had now grown a boy of 14 in August, was quite well & much improved. Chest well formed, laryngeal muscles quiet, & larynx normal. Yet his syllables are slow, & the least thing causes crying, & he is therefore still backward. He can pronounce all the consonants, but has still to be taught like a child how to use his tongue in the articulation of sounds. He had severe eczema when young, which caused the eyes to become blood shot - At School he does not learn well, though other boys, & indeed he requires a teacher all to himself. He can swim well, yet cannot scarcely read, & pronounces though he knows the words -

Ly Ct Jervis 2p
Am Bromd 8 24
Apnea 2 yrs 1m
C. may. his die.

still a nervous boy - I therefore discontinued this, and enjoined special teaching thro' a visitor or a female at the school, & still had no doubt eventually of the result -

30th His mother & eldest sister came to day, & I gave the latter instructions how to teach him both the sounds of the consonants, especially g & r - & she seemed quite to understand my views in the matter -

44 Extensive Follicular Disease of the Fauces and Soft Palate; dysphagia; sloughing of left tonsil; with great general prostration & debility -

Mr W. Harris, act 36, Conservative Club, St James, came to me April 26th 1863, recom[mended] by Mr Birkett -
3 months ago was attended by - Mr Hare he caught cold at the Illuminations 7 weeks ago, altho only an hours act - had sore throat, applied bran poultices which brought out a good deal of rash on the skin, & then finding it did no good he consulted a gentleman & he touched the ulcers with [caustic] but acy, & since then he has used a caustic wash & sponge every other day. His throat is very little better now than it was 6 weeks ago -
For the last 6 mos has had, he says, something flying about him, his ankle & knee joint were sore, & the remains of old sores are visible about the legs, he thought he had better health when they were open -
No dyspnoea - Has taken 100s of Iod pills & bucketfuls of Sarsaparilla - Thinks his malady constitutional -
About 6 mos ago, had such an attack as the present came on without any cold -

Present Symptoms Great difficulty in swallowing solids of any kind, fluid he can get down - can eat meat. chiefly living on beef tea & arrow root - before this he has meat for breakfast, lunch & dinner & ate heartily - night perspirations especially about the head - Speech is thick, pains in ears awful, extending to the throat; had night perspirations before present illness, but none except when an invalid - In drinking tea, even with rusks, has dreadful pain - even his own saliva - Has not been out for days, except in carriage - At times, irritability of throat produces cough, & spat that he has been smelling Chloral & Cresoli, but it gives him a headache - Sometimes runs down the nose sometimes holds up his hands to swallow - Expectoration scanty, but little, he considers he has no cough to speak of - Never has thirst -

Laryngoscopy &c - Fearful throat - Chronic hyperæmia & great swelling of the entire fauces & soft palate, not involving the larynx - Mucous membrane of palate mucus colored & pale - Large brown slough, the size of an olive 6 covered the left tonsil - Frothy mucus exuding from the follicles in any direction, they are enlarged, granular,

in the fossae

& ulcerated, even at the base of the tongue, in front of the epiglottis; the last was blanched. Mucous discharge of both nostrils tenacious & secreting. Fauces bleed from gentle application. Case was one of several follicular diseases of fauces & venturi pharynx.

Applied Sol Tannin twice with great relief.

Rev G. H. Whitaker, Earsworth, Leeds. 28th April 1863
all his life affected with sore throat, never asthmic -
In June 1862 had acute laryngitis - when young he was told he had asthma - Health never robust - Typhus had 16 yrs ago, never been himself since - Attacks have been frequent of sore throat since - no dyspnoea - when ill voice is husky, rough &c - Complains dark & congested. when ill he cannot do duty & all his strength is gone -
Laryngoscopy. Shows tallcular disease of larynx & trachea & certain places, with redness & partial congestion.
He asked if he would have to go to Italy, I said no, & that he would be cured - applied Sol Tannin to all -

c. mag his die -	Haustus m & c -

He came to me thro his son at Cantab, for whom I left my book.
May 12th Throat much better, but his general health not good from the prevalence of N & E winds while in Essex - Constant head aches for years - bowels generally constipated; low spirited

54

His head is sometimes headaches - p 80 - regular but weak - at times. His throat feels stronger & he could not have gone out in the bad weather he had met with - The fauces were already improved - Larynx showed the epiglottis less pendent, & the rima less contracted & much firmer - a deep hollow ulcer lay at the right side of the base of the epiglottis - This was touched with Sol of Bad Silver - & Tannin to fauces - Uvula rather long - ℞ Pod. Kept on pr ij Extr Cornii gr iv - altered ℞ as marked in Red - dim in fil iv. 1. p.r.n. Prescribed for his medical relation in the country, the long account as in my book 9 gr 6 ij 3.

July 14 He wrote that his health was much improved, the throat much stronger, soreness gone except when he feels a depress at the top. The unpleasant feeling down the throat into Chest gone - Uvula more elevated - Is stronger & able to do more work than for some time. He feels assured that my treatment has been of benefit. He finds the whisky & water to dinner & Early glasses of Claret after agree with him. I wrote on the 16th to continue the treatment -

Oct 29. Cold & damp weather lately threw him back, but he had continued Med & gargle to date, which was wrong -

1865 **The Rev E. R. Nares** continued from page 30

March 20 Had an attack of cold on 18th & E. winds & dyspnoea from contraction of trachea at bottom of the tube. Mr Hallhouse saw him last night - Better to day, but contraction is still considerable - Take Cl Ether & Blk drop on ℥x & night & I prescribed a pectoral mixture as well -

21st Very much better, passed a good night & breathing quite easy. Pt as before. Mr Hallhouse & Mr Nares to visit -

22nd Feels very miserable, breathing almost the same, and the contraction is evidently going on within the trachea.

23rd Snipped off end of canula, so ulcerated was it & the throat generally - Rather out of sorts to day. Some dyspnoea in night

24th Visit at 3 am. Swallowing fluid, it passes, or some of it, out of the Cannula. This began at 11½, & is followed by violent coughing. This I found to depend upon the passage of the fluid over the epiglottis, and he could drink well on his back, flat; or on his right side, and swallowed a tumbler of Soda water & brandy well in the latter.

25th 3 pm. about the same, but can swallow even it, with a very little passing thro tube. end of canula like an ulcer, applied Sol. Nit Arg. Salivation a little less - A little pudding passed thro tube.

26th Swallowing still with the same inconvenience - Thought I detected a fistulous opening at back of larynx thro the opening in front of the neck - does not take so much food. The posterior wall of pharyngeal surface of cricoid cartilage, on right side is a foul ulcer, seen for first time, during retching with a large mirror in the mouth, & am satisfied that the food passes thro the fistula suspected. Is already thinner & fully benefited, & regains from eating even recumbent food passing into larynx & causing coughing - Even his dry sandwiches now come thro - & all last night some of the saliva - Sunday - Yet his pulse is good

27th Since 4 am it has not coughed thro so much. Takes Chocolate Blanche Marye naturally sitting up well - Consult with Mr Hallhouse who agreed with me in the nature of the case - Making ulcer of throat penetrate the larynx -

28th A shade better, ulcer is better looking - but coughing as before & pustule,

29th Certainly less comes through the tube & is somewhat better - do

30th about the same - 31st Still less comes through the tube -

April 1st Had had a good night, but he looked very bad & was weak & fretful. Much mucous discharge mixed with blood from the trachea as if from a cold - Has taken Jodial meal Beverage pretty well -

2nd woke me at 6 am, that fluids pass out of the tube in the neck as quickly as swallowed & that he is worse, & very thirsty. Throat feels thick as if a lot of phlegm there, which he would give the world to remove -
3 pm very pale & wretched looking as yesterday - Has recovered power of swallowing without its passing through again - p. weak -
3rd Great dyspnoea during the night & secretion from the trachea. Contraction increasing - p quick & irritable - Rest mix & iodide 9 pm (5 & 6) drops Chlorof if this persists to rest - Better when I saw him at 3 pm -
4th. Altogether better, had slept well. But the ends of the expectoration rings scratch against the end of the silver tube - last night the breathing was quiet & free from any noise - To day it is noisy again -
5th not so well again, much bloody discharge passes down the tube with his food - p 104 - breathe hurried - some dyspnoea -
6th Better again to day, slept well - Still much oozing of blood from below - Throat is better - Sol alum -
7th a good day, but drowsy, & the food did not come nearly so much through, but there was wheezing occasionally
8th not any worse, about the same -
9th Rather irritable, and much wheezing -
10th A Bougie would not pass thro the contraction in the trachea. Had severe retching & straining to day - much pain generally, had passed a bad night, for he took no drought. Saw Capt Adams to day -
11th Wonderfully better & easier - slept 12 hours at a stretch & is much composed to day - breathes pretty easy -
12th Bad night again with extreme dyspnoea, inspiration at times, like whooping cough. This prevented his sleeping at all last night - & he coughed much. Expectoration occasionally purulent -
Contraction of the trachea is evidently increasing.
13th A better night again, with much sleep - but dyspnoea during the day - Used Inhal of Zn Spray with Weiss' Inhaler -
14th Pretty fairly - Inhal as before - Dyspnoea great at times -
15th Dyspnoea several times in night threatened suffocation, only relieved by Chloref - ordered Chloreth as well - Inhal of water only - Carried comfortably when asleep breathes as quiet as a lamb, with no stridor -
16th was drowsy, fair night, but at times dyspnoea - Inh of H2O
17th At 4 am I was roused to see him as the dyspnoea was most severe, but declined when I got to him - The contraction is evidently increasing - Eth & Chlorof had been used - At 3 pm, the dyspnoea

Saccharine Throat, with fallicular disease and sweet taste in the mouth.

Dr E Nesbitt of Egham Hill 30 April 1863

relaxed throat & larynx some years, like Mr Pearson - making falsetones, fallicular throat - Same kind of expression as him - Epiglottis very dependant and stupid with red vessels entering - fallicles enlarged -

Quoted in Ed 2

---

was again my hand & he seemed gasping for breath, and at times felt as if the blood was rushing to his head. A metallic bougie would not enter the constriction of the trachea.

18th Under expectt mixt, there was more secretion & freer breathing. Saw him with Mr Holthouse at 3½ pm

19th 3 pm - Tried to introduce Bougies thro the stricture part had in vain, and the stricture was made worse always by the passage of drops of fluid into the trachea whenever drinking, pr although a portion passed out of the cannula, yet some was drawn in at the same time. 11½ pm. I was more fortunate, & passed a fine gum elastic very flexible bougie & then a pair sized wax one with great relief to the breathing. He was taking at same time expectt arantii every 2 hours. Yet now more fluid passes into the upper larynx, because the ulceration of the larynx & swelling of it in the throat is seen with the Laryngoscope to have increased the

60 last 36 hours. He is getting thinner & weaker, & takes now less than his dij milk in 24 hours.

20th Sent for at 6 am to relieve the dyspnoea & again passed in a Cayer wax bougie still, twice, right through the stricture with immediate relief and ease. He is getting feebler too. 3 pm relief had been variable but the breath was now foul. I passed in a Cayer wax bougie there at 6 am. Had slept some & took food better — 10 pm. Breath still bad, passed in the Cayer blunt end of wax bougie, at intervals, twice, but the contraction was pretty firm. Staid with him till 2 am.

21st 4 am. Sent for, as he was worse & I found him quite cold, & covered with sweat, pulse feeble, breath bad, chest ringing wet. This last I changed, and an attempt with the bougie failed & produced bleeding. After milk & brandy, he fell off into a sleep and slept well & easy until 7½ when I left. He was then better, but for a time only, the flicker of light before darkness.

1 pm Sleeping quietly, breathing very easy, so for several hours.

8 pm actually sitting up & quite active. took milk, soda water &c. & his own drink. p 92, rather weak. Breathing easy, but coughing a little. I staid till ¼ to 11.

22nd 1 pm. Sitting up, restful, but breath foul & pulse not bad, and he was about the same at 8 pm, but perhaps breath not so good.

23rd 10 am. & 9 pm. The swallowing is not so good, as more comes through the cannula & is occasionally sick, but it is now regurgitation & not retching. Breathing variable, relieved by chloroform in the evening. pulse 100 soft. very thirsty.

24th 3 pm. There is much difficulty with the stomach, from acidity &c, & the ejecta frequently resemble cocoa. + for last 2 or 3 days. Has taken chiefly soda water since yesterday. Breathing good & bad, had to introduce a wax bougie through the trachea, with not inconvenience. p 84.

9½ pm. easier but drowsy. breath foul. Has looked bad today.

25th Quiet all night, & slept a good deal this morning seem up to time of my visit at 3 pm. He was too feeble & weak to sit up especially after an action of the bowels from an enema & had to be put to bed again, when he fell asleep from exhaustion. Difficulty of breathing has quite ceased. not half as strong as yesterday.

26th Exhaustion has increased, for he can scarcely raise himself in bed without assistance. Yet pulse is a little better.

Continued at page 67.

Mr John Hanson, from Ireland, came May 13th 1863
to the agent for the Estates of the Greig, a landed proprie-
tor. Mr Hill called upon me about him on 21st March,
to know whether his case was curable, & I said I thought
it was from the account he gave - he was then aphonic.
Is aged 40 - healthy looking, with a reddish tinge on
each cheek, & partial adhesions expansion, but
perhaps due to exposure - 18 months ago, was convers-
ing very loudly with a deaf person gentleman, when his
voice broke down and suddenly went away. There
was no cold or other cause to account for this. He caused
not sing nor read the end of October, and the voice
broke down & was reduced to the merest & almost
inaudible whisper. In January 1863, he underwent
water cure with advantage, in Ireland, under a
gentleman at Belfast. At the end of March the
voice gradually returned & is now gradually getting
stronger; for the last 3 days is feeble, but for a month
has been better - general health much improved now.
Changes in weather affect the voice - He says he is

non subject to sore throat, never mumps, & seldom has a cold - not subject to cough either. He had pain in the thyroid cartilage for about 2 months.

Larynx - Epiglottis partly pendant. Slight congestion of the larynx, but vocal cords now natural - Mucous some congestion in subglottic space, & upper trachea -

Shower bath &c.

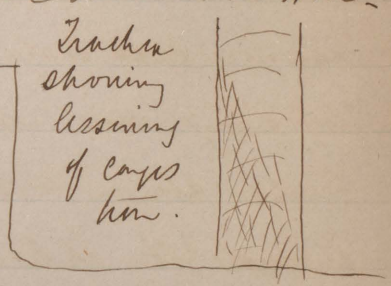
I told him he would get quite well - but he must be cautious about himself for sometime - I told him he might take a glass of Wine, which had been stopped -

11th Voice already stronger & he feels better - Came with Dr Hill. Had Shower again with advantage pt -



Growth on the right Vocal cord.

Rev^d S^r Williamson continued from page 361

July 4.64 Sol Alum & SO_3 to growth - Herpes circinatus
Ung 3iss ad 3ij
Ext Belladr gtt vj. m q. n. to Crupton -

7th applied same Solution - the growth looked thus ⓒ, a band of lip like margin around a central projection -

11th Glycerate of Iodine. & Pt Gargle - Growth less prominent.

18th Exam^d in presence of S^r Burrows, when the cords were seen whiter, and the growth flatter & less prominent -

Aug 17 About the same, Voice is a whisper, the growth seemed a little more forward, & the outline of both cords was well seen. Much general congestion, of Larynx, removed by 2 doses Sol Nit Arg, & excessive irritab removed by sucking ice. Suggested quiet & 2 mas at Scarborough - This was approved of, S^r W did not like instrumental interference.

May 27. 1865. Since last visit symptoms have been progressing, has now difficulty of breathing, little cough, occasionally spasm, more irritability and discomfort about the throat; snores loudly in his sleep - S^r Burrows found his lungs sound, but the breathing tubular from the difficulty of entrance of air above - Saw in his presence at 2½ pm. Showed general pulpy redness, & diffused swelling of right side of the Larynx, extending beyond the middle line & left side, and descending in it as it were the former growth, the apex or top of which with a depression was distinctly visible -

The right true Vocal cord was concealed, but a small portion of the left was seen, white; the aperture of the larynx was however much contracted & fully explained the dyspnoea at times - Dr B & myself agreed in the propriety of not interfering with the Larynx itself - & prescribed Tr Iod externally to the neck as a counter irritant, and the use of Iodides & Quinine internally, Chloroform to inhale when the spasms are present or obstinate coughing - Dr B was to write to Mr Carden, Surgeon of Worcester to be prepared on any emergency to perform Tracheotomy, if it should become necessary at any time.

Inhaler of Dr Spray wh Weiss.

July 12. Accompanied by Mr H. S. Webb Surgn of Welwyn he called on me. The entire Thyroid Cartilage had considerably swollen in every direction within the last 3 or 4 days & was producing dysphagia - The Breathing had been getting gradually worse since he was last here & now it has a stridor of obstruction. Has had more frequent attacks of spasm but not since the Thyd Cartg has enlarged. Some bloody expectoration last few days. Laryngoscopic examination - Extension of the disease to the opposite false cord & posterior part of the larynx, no true Vocal cord to be seen, & the aperture of larynx is very small as in fig above. The laryngeal surface of the epiglottis is distinctly seen & not covering up the swelling behind it as before. All the parts intensely congested, including the epiglottis. Yet the examination was easy. The extension of the swelling externally is extraordinary & ominous, & is no doubt about malignant nature of the disease - I learnt 2 of his relatives died of Cancer, one of epithelioma & one of Scirrhus, as Mr Webb told me - I advised Tracheotomy at the earliest possible moment & my opinion of the nature of the disease, I learnt from Mr W was that of Dr Burrows who was not able to be present. His friends took him to Mackenzie the last time from me, who said it was phthisis of the larynx. An opinion which Dr Burrows did not at all confirm -

Continued at page 82.

Revd Wm Culpepper, of St Kitts, W. I. came May 15th 1863
with Dr Doyle of Upper Brook St. But he had been recommended
to me by Dr Nicolson of Antigua. aged 33.
about 12 months ago throat suddenly commenced
with much dysphagia & dyspnoea at first, hoarseness
but no pain. but has had more or less pain in the throat
ever since at right of the root of the neck, sometimes
shifting to the left. never had aphonia, voice very good
& strong, but weary after preaching. Is exceedingly ner-
vous (pulse varies & feeble, 16 & 20 per minute) & irritable
& suffers from headache & indigestion all his life.
Suffered from old Bronchitis, pains down right side of the chest in
3 directions, thus ⋀. Blistered frequently. Asthma and frequently.
Larynx showed much chronic congestion of the trachea, as far
as could be seen, & right up to the epiglottis. Cords normal.
larynx congested slightly. epiglottis a little pendant.
Dr Doyle told me there was indistinct breathing in right side
of chest.

June 3 - Free from all pains in chest -, but tenderness remains at right root of neck, probably rheumatic - To have rem Rx & to pt people - going to the country for a few weeks -
Larynx & trachea perfectly normal -

The Rev E. L Nares continued from page 60.

1865

April 27. A little stronger & swallows a little better, but had much cough in the night, from window being open in the day.
28th Better still, but unable to sit up. On waking he says he feels as if he was to be suffocated -
29th About the same, but feels easy, but is weak, p 72. very yellow - swallows better & less vomiting - expectoration increasing - slept well from his 3 to 7 of Battley - 30th very cachectic looking. In swallowing some milk I saw a little come thro the nose; has a sense of dead weight in front of chest. p 72 weak. Rather weaker to day.
May 1. Restless in night, but free from cough or pain. Chest better - pulse 84 and weak - bowels open last night from enema of soap & water
2nd. Quiet night, but coughs when sitting up in bed. made him put on his internal merino vest - Draught to be 35 minims -
3rd Retched violently last night, & an hour after, the mouth filled several times in rapid succession with bright scarlet blood. and there was much blood mixed with the expectn from below. To day I find the ulcerated part of the throat near the right side of the epiglottis enlarging, as well as the back part of the top of the larynx and cartilages projecting backwards.
4th Drowsy & sleepy from substitution of Sol Mur Mang for B battley.
5th Much cough last night from no draught - Is now getting decidedly thinner, & the cancer of the throat is seen to be increasing -
6th Had passed an excellent night & was quite comfortable to day, from 40 m Sol Mur Mang - no cough & had swallowed well.
7th Quiet night, but some dysphagia, the epiglottis is more elevated being pushed up by the growing surrounding epithelial mass. Most fluid therefore passes through the cannula - p 84 -
8th Visit 6 am. Much dyspnoea this morning & feeling of suffocation obliged to pass a wax bougie through the trachea - weaker but pulse slow & regular
3 pm. had rallied, but weak, p 65. Administ brandy - but little fluid entered stomach
9th Better, p 65, felt stronger but faint occasionally. Throat seen about the same, & a great deal of fluid passed thro tube.
10th. Had taken oij milk in night. Passed blood & pus by stool -
11th Vomited large quantities of fluid all night with coffee grounds, like, & part of this morning. Bleeding from trachea & throat as well, looks quite blanched & exhausted -
12th Passed a quiet night without any more sickness. Is weak - Bowels open twice in afternoon, followed by most extreme exhaustion.

68 the second stool, seemed as greenish pus and light bile.
13th Bowels rather relaxed & had been sick again in the night - altogether uncomfortable, altho not so much bleeding. Enormous quantities passed from bowels & stomach, apparently more than eaten.
14th Rallied with pound of sennie & he was quiet, but weak. The growth in the throat was seen steadily enlarging. He had not taken much nutriment since yesterday -
15th On the whole weaker, pus around the tube ulcerating & discharging freely. Bowels quiet. Cannot move in bed without assistance - p 84 weak -
16th So starving, for a great part of his drink passes down the cannula & he coughs & chokes & frequently vomits. The breathing thro' same is bad now & then & I had to pass the blunt end of a large wax bougie into the trachea. Odour is purulent, & all the parts are becoming ulcerated, & the swelling around the epiglottis is increasing.
17th Chloroform relieved his breathing, & it was used almost all night - but it became very bad in the morning, and urgent during the afternoon - at 5 pm he was almost moribund, but rallied a little after passing a Bougie wax down twice. His hands were cold & clammy and he was dying. p 100 & very very feeble -
At 8 pm He still inhaled for chloroform which stimulated & relieved him, but he was now too low to rally, the heart began to flag, got weaker & weaker, breathing louder, & died quietly at 11 o'clock & 40 minutes, without secretion of mucus in the larger air tubes.
Autopsy on 19th at 3 pm, 40 hours after death -
The whole of the posterior & lower part of the cricoid cartilage & external parietes of the pharynx was destroyed by epithelial cancer, and the larynx & pharynx communicated in rather funnel one large passage, so that anything went down both, part coming out by the tube & part going down the oesophagus - The epiglottis was surrounded with hard scirrhous deposit & encumbered like with the L - The rest of the oesophagus downwards, with the stomach was quite normal, & also all the viscera, except the liver which resembled the fatty organ of phthisis - all the structures & tissues were gorged with fat - Lungs & heart perfectly normal; a pen-nib plummet cicatrix in left chest - P.M. made with assistance of Mr Hallaran & Dr Temple -
The larynx was nearly quite blocked up with hard scirrhous masses & the glottis & subglottis were filled with them, in the last, the prominences of part seem more blended with the malignant disease. The upper part of the trachea was

Continued at page 75

The Revd Francis Bacon, Rector of Spilsby, Lincolnshire, whose wife I am attending for miscarriage, came to me May 21st 1863 about his throat - although not ill, he occasionally has to stop preaching when irritation of larynx comes on in the Church - but his voice in singing & speaking is very powerful indeed - Chest is weak. Larynx showed the larynx normal, with very slight relaxation of mucous membrane; that in the fauces is pale, relaxed, & in places patchy as if scraped out with the nail, covered with a yellow film. Has had to be careful of his stomach all his life - Applied sol of Tannin to the fauces with benefit. & He was called to Lincoln & sprayed in each & throat - Ry Ammon Brom 3ij / Glycerine 3ij / Aquam ad 3vj. M. / S. r. n. / To be used as often as he can.

March 18th 1864 examined throat of little boy, aged 3, who was very pale & ansemic Vin Ferri 3j quotidie - Ry Liquor Arsenicalis 3ij / Glycerine 3ij / Aquam ad 3vj. M. / S. r. n. / To be used as often as he can.

Mr B had flying pains about head &c 22nd Visit - rheumatism of left shoulder & side of chest - Mother rheumatic - Ry Liq arsenicalis 3ij / Glycerine 3ij / Aquam ad 3viij / M. / S. r. n. / To be used as often as he can.

24th Nearly well. pain in shoulder - has used electric baths as well - wedding comfortable -

Follicular disease and Cardiac dyspnoea, Calculus in the Kidney, &c.

Dr Riding, aet 64, came to me May 25th 1863 about his throat. 79 Kensington Gardens Square, Bayswater. W.
Voice always weak in talking much & frequently too lost. preceded by hoarseness. When overwarked or worried it has an influence on his vocal apparatus, the 8th pair he says being at once influenced. Is obliged to avoid society in consequence. Terrible attacks of dyspnoea in paroxysms at night particularly; has a feeble heart he says, breathing embarrassed in going upstairs, probably fatty degeneration of the heart. Dr Williams said there were a variety of cardiac conditions some years ago depending upon the brain. Has calculus in the Kidney, which probably causes expenditure of the urinary elements in the system. Urine often scanty when these dyspnoeic attacks come on, & irritability of the bladder & pain in the Kidney. Dr Golding Bird & Copland attended him some years ago. occasionally he loses his vision in writing his Recipes. Had one day loss of speech which passed off in a few days, thick at first & then loss of speech. Has probably too he says some emphysema of the lungs, pneumogastric no doubt, he says

much influenced. Lymphatic temperament, stout, flabby, & flabby.

Laryngoscopy - Showed general relaxation of mucs: mem: with water pallor & relaxation & secretion of larynx & hairless & pharynx - epiglottis pale & structure with vessels. Lingual tongue - Follicular disease as well -

1868 Mr Bailey continued from 56

June 8. He came with Mr M. J. Coleman of Surbiton who had attended him for many years. He was aphonic, and had been so for the 5 years since he saw me, with pain also down the throat all that time; was 3 winters at Torquay & 2 at Ventnor - Dysphagia present two & off all that time, which he (at had 25 yrs ago, when Mr Scott passed a bougie 400 times, & generally a very large sized one. Sir Wm Lawrence said & I endorse it, that he never could have had a true stricture of the oesophagus, must have been spasmodic. He got over that & became a hearty man. He could not cry out loud now. Been under Dr Walshe, Williams, Quain & others, lungs all sound, no cough, & has taken almost everything in the Pharm, including Iodides & Bromides, the latter

Mr Nares continued from page 68

contracted & filled in with malignant deposit, & on slitting up the tube there was no ulceration or true stricture as we had first supposed. That contraction was at the upper part, & the portions of necrosed rings, expanded, compressed the upper part of the tube also -

In Times of Feb 15. 1868, amongst the Deaths, was

- "On the 14th inst, at her residence 12 Warwick Square S. W. in her 70th year, the Lady Henry Spencer Churchill, widow of William Whateley Esq Q.C."

---

always affect his head. Their opinion & treatment were all alike. Has been lately losing flesh & appetite, though never was stout, eats 2 meals a day. Always eats a good breakfast, very bilious, Is able to swallow fluids & solids well. Nitr Arg was applied by Mr Coleman without any benefit, & he was advised not to have local applications. Is much tenderness about the neck all over, back & front, glands enlarged there, particularly near hyoid bone. Larynx generally - very easy - fauces coppered with long excoriated patch on left side of pharyngeal wall as if scraped from top to bottom with the nail - mucous not there so much relaxed as in the larynx & trachea. Was copper tint in upper larynx, & white as on left vocal cord; both

76 mm of an ashy grey, runny fluidity, no tension to produce sound. No ulceration, or other disease was observed. used Spray of Zn with Clarke -

daily at Clarke 1 m.

Mrs Biggs aetat 44 was brought home 26 May 1863
by Mr Arthur Serjeant, Surgeon of Peckham -
Is the wife of a Clergyman who is nearly blind & a very
learned man, & has been compelled to tax her strength by
studying through her eyes & Signal apparatus, frequently for
8 hours a day. Her father died of laryngeal phthisis -
Notes 4 years ago - aet 40 - Constitutional Cough of 20 years stan-
ding, worse the last 6 months, but not necessitating confine-
ment to the House until the last 3 weeks - Menstrua-
tion regular - Cough hard dry & short - Left
Lung dull on percussion throughout - Breath sounds
weak but universal throughout left lung, and in-
creased in right or sound side - Decubitus incli-
ning to the same side - Impossibility of resting
on left or diseased side - occasionally slight dys-
pnoea and dull heavy pain in left Hypochondrium
which is relieved by counter-irritation. Excretions
perfectly healthy - Tongue furred and bright red
at tip and edges, and clean - Breathing always re-
gular and ability to inspire deeply without much pain -

Pulse was always very small & soft, often 120, regular - nervous temperament -, appearance not emaciated, not wasting - cheeks often exhibiting hectic flush. Father had pulmonary disease. Brother died of Aneurism of Thoracic aorta. Sister of Puerperal fever. There are 5 or 6 Brothers & Sisters still living. Says there is nothing the matter and that she feels able to do anything. The least exertion or excitement causes exacerbation of cough. Breathes as well in horizontal as an elevated position. Vocal Fremitus not very appreciable on either side. Stethoscopic signs not affected by prone or elevated position. When in pain it is always referred to the left Hypochondrium & back. About 2 weeks since had an attack like ague, setting in with oppression of breathing & shivering, lasting a short time, followed by a hot stage which lasted a few hours. This occurred daily and after 2 or 3 times at intervals of 2 days, then 3 days and not after. June 13th has been confined to bed the last 4 days, 3 weeks from the attack of intermittent fever; has been free from it the last 8 or 9 days and altogether is better - Pulse stronger & averaging about 90 - Cough not so irritable & it is controlled by seda

atives when required. Bark and Chlorie ether & large doses of Ammonia have been regularly given, & 2 Blisters applied to the back. "

Dr Johnson saw her when the above notes finished and differed from Mr Sergeants view (which was that it was congestive pneumonia) and pronounced it Neuritic effusion. No alteration was made in treatment and recovery quickly followed, and delay other followed by better health, until the last few months when the Cough has been troublesome at times, but kept tolerably well by taking night anodyne draughts. Miss B has been weak the last 3 months and suffering from profuse and irregular menstruation and not liking to impart this additional trouble went 2 or 3 times to Dr Johnson who examined the lungs & found nothing much wrong or did I on making a partial exam: 14 days since. The mischief appears to be laryngeal & the disease peculiarly demanding the application of topical remedies. very susceptible of atmospheric changes.

The present treatment has been for the congestion of the Uterine system, sedatives at night & persistent use of Tinctura Ferri Muriatis. Contrast the

passive hemorrhage. She has been under Mr Lepine's care the last 6 weeks, & Johnsons prescriptions not proving successful.

Nasal symptoms - Besides the purging, I saw she was pale - had no dysphagia - nor tenderness of the larynx - Laryngoscopy. Showed the parts natural, but the mucous membrane much relaxed and congested within the larynx - trachea normal, saw as low down as 8 or 10 rings & so did Mr Lepine; follicles dotted with red in pharynx & a streaked ulcer near the left side. Few red points also in the larynx. Tonsils natural pink & healthy looking - She had cured an ulcer on the left tonsil with caustic - She has had to rise lately to her husband some 8 times per day, and it no doubt brought on this commencing condition of follicular disease; & as it is taken in time is quite curable -

Has been ordered a citric acid of the mixture alternately, this to be continued only - Anodynes at night around the cough & the steel aperients will suit her -

I applied a sol of Tannin to the larynx & had sitting to the pharynx - She must be kept at rest by not reading or talking much until well - Sol of Tannin to be

applied to the larynx and occasionally sal hirt aryati.

In the Times I read of his death on 11th Septem at
Datchworth Rectory - Vicar of Pershore, late Head master
of Westminster School, aged 62.

84 Follicular disease and impaired Voice for 2 years, great congestion of the trachea and Sub glottis, perfect recovery -

Rev Thos Nelson, St Peters Rectory, Lincoln, May 27th 1863
Came to me with his wife - St Peters Rectory -
Two years ago his voice got weaker & weaker until he could do no duty. Never could undertake the whole of the service - About 3 weeks or 1 month ago Voice was better & all at once it became a hoarse whisper & went away - Slight exertion produces this -
Health has not been good, has been debilitated -
There was aphonia lately for several days, could not utter articulate sounds - Has always been weak about the Chest; voice clear whilst he had it -
A bright bracing atmosphere suits him the best; 9 or 10 years more or less single handed the whole time, and has done overwork - every service quite unbearable if gas used &c - Atmosphere stifling - (Scarcely a days illness for 12 years she said)
Voice first would thicken & then become worse -
Laryngoscopy showed relaxation & pallor of mucous membrane of larynx & fauces, with congestion of trachea & sub glottis - Cords white, but watery looking - Marked ulceration at back of pharynx shown to his wife - Contemplates going to

applied Sol Tannin
& Larynx & Pharynx -

Mr John Davids, Surgeon, Cowes, came May 28. 1863 -
Isle of Wight. Short healthy looking man of 69; but
not seeming more than 60 - He says;
Sore throat all his life, yet with apparent good health.
Good deal of ulcn of soft palate after colds - followed
by ulcn of epiglottis, with violent Coughing night
after night in bed. Had irritative cough after
influenza &c - Has a loud Sonorous voice.
When he takes Port wine (Oj or so) cough stops
at once - Always susceptible of cold -
Usual cough since February, ~~Constitutional~~ Continual
itching of the larynx, especially right side, he could
put his finger almost upon it. No pain in neck, nor
dysphagia nor dyspnoea - Mucous secretion more
than usual - Laryngoscope quiets it a little.
Laryngoscopy - Slight ulcn, not from follicular
disease - Larynx a little congested - epiglottis more
so, partly pendant edge & right side when it is in
contact with the fold of mucous membrane on the ant
surface of the right half of the epiglottis is an

ulcer, with elevated margins, & inflamed surrounding membrane. His deaf also, & explains many of the symptoms. He had surmised something of the kind at the edge of the cartilage. The sketch shows it

may mell. I touched it with a sol of Nit of Silver, & the pharynx with sol of Tannin.

Paule m & e –

I advised topical use occasionally of Sol Nit Arg & of Tannin – He had read my book & had used the former – & quite agreed in the propriety of notching sal ∂ples strength thereof ℈ij – He feared me to accept a fee, dollars, dollars; –

June 5th. Rec'd a letter from him. His cough is better & seldom troubles him at night now, & the purple m & m – but had not commenced the Mix – I wrote him to do so – I learnt after he took the Mix for 2 weeks & pol quite well –

Aug 20. In a letter he says the cough returned again worse than ever 2 weeks ago, from checked perspiration, & nothing does him any good – I wrote & suggested use of ℥ss of Camph, Liq Am Acet & Ant pot tart ℔ss to relieve cough & irritation & the appl^n of Sol Nit Arg to Velum & pharynx, in addition to what

& Iodine to the neck –

he spoke of in his letter, namely Liniment & Lin aeruginis –
And requested him to come up after 3 September –

June 8th 1865. Got quite well after I saw him, but now cant stand the Winters, he gets so chilly & cold. Last Aug 1864 he passed quantities of phlegm from the larynx he believed, & had would sniffed off entirely. Now Nothing but relaxation of the mucous mem. of larynx, without any congestion, epiglottis perfectly normal, in shape, appearance, &c.

Inhalation of Zn Spray ala Weiss
& advised him to continue it
Dr Budd had recommended him Liq Fer gtt i
with other things – but I suggested

℞ Sol Cit Chinin & Fer
(Bastien) ℥j
℥ss bis die ex aqua.

His voice is excellent. advised Port in place of Sherry –

March 21. 1866. wrote he had reason to speak well of the fluid extract & Zn Sol in relaxation of larynx ala hoarseness & has been quite well – after Easter, but Sunday ago a bad cold ended in a laryngeal cough which comes on in paroxysms & bothers him at night. Zn Spray does now now relieve. I advised Spray of Chlor of potassium diluted 1/2 or 1/3 – or Sol Zn acet gr 4 ad ℥ss – Sample of Glyc Al & H2O – & Mix Zn Camph Co – Opium & Scilla.

Alexander Pain aet 39 came to me on 29th May 1863 from my friend Mr Ernest Hart -

Two years ago Mr Hart removed a large central piece of the upper alveolus in a necrosed state, which has now left a large opening leading up into the nostrils through which can be seen the turbinated bones

When he could not speak, eat or drink without the opening being plugged up with a piece of wadding -

Last 2 or 3 mos had a cold, & felt a soreness of the throat. 2 weeks ago he had pain in swallowing as if a knife was cutting him & he could feel a little thing like a marble shifting about at the back of the roof of the mouth, as if there was something lodged there in the nose - Breathes thro both nostrils but sometimes it is stopped up in the right. General health now pretty good -

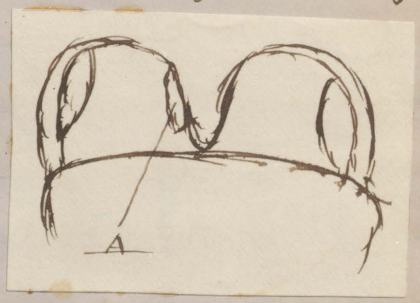
Rhinoscopy showed some swelling of the right nostril at its floor, near the corner, like a tumefaction of the mucous mem:, but not a distinct tumour -

Abnormal uvula -

Thomas Rutherford act 26. came to me Nov 10th 1883
from Dr Wright -

The Dr wrote that there was either an arrest of development of the right muscle or a mucous polypoid outgrowth from the right side. If touched with a probe it was seen hanging like a fluke - and this was quite true, 'tis shown in the sketch at A. The mans history was pleurisy of the left side phthisis of left lung, 2nd stage - right lung healthy. had been in Brompton Hospital -

Referred to
Mr Ed R



destruction of the perforation of the epiglottis, from ulceration and disease of the throat for 4 years; together with partial of the arytæno-epiglottic folds -

Mr James H Lamb of Forfar, aet 27, came home 29th May 1863 by the advice of Mr Brace of Bath, who knows me - He advised me of his visit in a letter from Sion Hill, Clifton, Bristol, where he was staying for a short time with his wife. He furnished me with the following written history:—

"Naturally of delicate constitution, has been for a number of years subject to occasional attacks of Phagedenic ulceration of the throat & fauces. He has been put through mild continued courses of different tonics and alteratives, which in their turn have cured the disease for the time — but exposure to cold even in a slight degree is apt to bring on a return of the complaint. He has often been for months quite well. Early a course of Plummers Pill with Sarsaparilla seemed to have controlled the disease; also benefit has been derived from long continued mild courses of Liquor Iodinus & Liquid Potass; also Iodide of Potassium - Demovans Solution, Tinct Ferri, & Liquor Arsenicalis & Liquinis Potassae &c &c - all these different medicines combined with the use of Decoc Sarsae. The local applications

have been Sol Nit Arg, Sol Cup Sulph, Tinct Kino, Emul Copaiv & Liquor Ammonia &c &c - Latterly he has derived much benefit from the regular use of a Respirator - I need not say his diet has been regulated and general health attended to. Brechin 25 April 1863

(sd) A Guthrie. "

"Present medicines - ℞ Liq arsenicalis 3ij Liq Pot 3vj. m

25 drops thrice a day -

℞ Sulph Cup 3j Aq destil 3j. Alcohol - to be applied with a small piece of sponge every few days -

℞ Dec Sarsae 2 or 3 times a day. "

I made out the following additional -

Has been ill 4 years with sore throat sent to Clifton for change of air & has been going backward - Has had tremendous ulceration of the throat & great pain in swallowing - The dysphagia was such at one time that he could not swallow fluids at all, & afterwards he could only take pultaceous food - Rather nervous & uneasy about himself, cannot attend to his business - Now he can swallow very well, but he feels a little pain far down the throat, especially during the last meal - Voice is good and strong, but sometimes it goes away entirely & if he is

the least fatigued & goes away in the evening. Always expectorates quantities of phlegm, never has measured it, but probably a pint in the 24 hours. Felt better from the London air. Has no appetite for any meal but his dinner & feels very drowsy after it. Has no cough, but a feeling of irritation as if he wanted to get rid of something. Is obliged to make 2 efforts in swallowing to get the food down. Sleep irregular; throat "dried up immensely at night." Pulse 130 & weak, but he had Rheumatic fever in 1857 with a little functional Cardiac derangement, pulse always quick since; increased also by an excursion to the Highlands some years ago, when he over exerted himself. Sometimes pain in Cardiac Region.

Inspection & Laryngoscopy. Uvula partly gone, & retains much adherent to the pharynx. Right side of nose tender, & sometimes stopped up. Tongue thick & enlarged & spasmodically retracted. The epiglottis was gone, & evidence of great destruction of tissue. He had had the solid Nit Arg used, & solid Pot: fusa & I am afraid they did much mischief, an opinion which Prof Syme of Edinburgh, also hazarded. No vocal cords could be seen, but fortunately a wide artificial glottis,

which permitted of easy breathing & narrowing of the trachea - The left side of the glottis consisted of a thick round swelling formed by the left arytenoid - epiglottic fold - No 1 -

The sketch shows the appearance of the parts, but I am afraid the arytenoid cartilages are gone also -

Improved. Very much better, has found the purple most comfortable - Expectoration & secretion almost wholly stopped & has felt much improved. The ulceration of the larynx is diminished one half, and the parts are more distinct, per sketches. Their movement is freer & readily noticed - No 2 shows the right vocal cord & No 3 both cords during forced inspiration with the trachea - The remains of the left arytenoepiglottidean fold moves inwards from side to side by the aid of the arytenoid cartilage; that on right side I fear is gone - Back of tongue at times feels sore, & has soreness in right side of larynx in the neck.

No 2.

No 3

Ulcer of the septum nasi can be seen with the eye, this was touched with Sol Nit Arg - The larynx with Sol Lod Arg

Came with his father to day -

and the fauces with Tannin. Expect'd a little blood the last 2 days with the mucus, which came from the throat & larynx, the mem. of which is assuming a healthy pink colour.

Pharynx still good - Ut omnia -

8th Still a little hoarseness in right side of neck, but does not look like the same person is so much improved - Came with his wife, a very lady like person - pulse 88 to day, but it is easily excited, the Bromide is improving the heart. applied Tannin Nit arg to canes & trachea & Sol Sod arg to the ulcer above with a brush - (In ℞ made Brom 3ij & added ℥ Nucis Vom 3ij - (shewed my larynx to them to explain about the epiglottis.) The swelling was less on left side in him, & ulcer much diminished.

10th Back of tongue raw & granulated. hoarseness, pain gone & tubes smaller - Touched it & throat ab Sod arg.

Went to Dr Falls about then a 15th & recd a Sol

April 5. 64. Turned up quite well, with the larynx quite or nearly normal, for the right V. Cord was beautiful & white, but the left could not be seen, being covered by the false cord, so that when approximation ensued the false cord was seen to meet in the middle but above the true of the opposite side. The trachea was quite distinct & normal. No trace of ulcer. The stump of the epiglottis was seen. Nose healed up. The false cord was irregular. Voice still low. He was leaving Eastbourne -

July 28. Has been quite well, save at first of nose healed & his assisting health considerably improved, since he saw me last. Within 3 mos has been much ulcer at top of same nostril, with great pain in the brow & thro the head. Dr Guthrie treated him with fly blisters with short relief, & Sol Nit Arg to nose - Pain good deal neuralgic, but constant in the brow - post results from the nose. & much discharge fr it -
His letter was dated 26th U.S. Manse. Nairn -
I prescribed for him

Continued at page 244

Ozena for 3 years, depending upon

Mrs Julia Smith, aet 26, came home 27 May 1863
with a line from my friend W Wright of Somerset St -
with a Dy = "Is there any mischief of ethmoidal cells."
Has had a discharge from the nose for 3 years, it does
not run down but she is obliged to blow it out, it com=
menced just before the birth of her first child. Was
in the middlesex Hosp 7 weeks. She went out for
12 mos then returned again a being pregnant. She
spits as much from her mouth as comes from the nose.
No pain till lately & it is acrop the forehead, over
the frontal sinuses. Nose was sore 2 years but that
has quite gone away - At night has a burning sen=
sation in the nose & throbbing of the frontal sinuses.
Had discharge of blood & matter 3 weeks ago.
Rhinoscopy in presence of Mr Lund of Manchester.
but there was too much sensibility.
29th Saw better, redness at extreme top of the
pharyngo nasal vault, but as there is still much
irritability, ordered a couple of { Brom of Am 3ij
& Aluin 3ij.
Aquæ 3vj - m

until she would come again

June 4 Rhinoscopy much easier, & she feels better from the pain the discharge is less - Inside ant turbinated & redness of the mucous membrane at the top of either nostril, leading to the ethmoidal bone and either the superior turbinated bones - Probably denudation of all these parts - Treatment - To use the pump by injection as well as by spray with 3ss of Glycerine in it.

℞ Am Bromid 3r ij
Tr Cand Co ℥x
Aquam ℥ss ter die -

This congestion involves in a minor degree the middle & lower turbinated bones besides the nostrils in front -

July 1. Nose became much better, the discharge now watery & colourless. In the last few days Med: disagreed, & was omitted - 1st fortnight it affected the hearing & then went off, she could hear the noises in her head; eyesight has got better. She looks very well about the face, & is at full term of pregnancy - The nose is regularly washed out - The smell from it seems bad to her -

Oct 6. Confined a 29 July, & baby now weaned - Head has been bad, nose always full & a quantity of mucus in the throat, but no smell from it - ℞ Pulv Asari Comp gr x
Pulv Rad Iridis Disp. M ft pulvis
To be used as snuff for 10 days q. n. - Quoted in Ed 2

March 18th 1864. Has been quite well since use of snuff, but last few days has a little discharge in the mornings - Has feeling of

℞ Calomel 8 ri v

pulling of both eyes, and I suspect something in frontal sinuses -
Rhinoscopy revealed nothing -
April 12. The sinuses & headaches are better, but the snuff is too strong - reduced the Red precip to gr i - still much matter comes away - Does her much good, more so than the last - 2nd finish stopped headaches -
July 14 Has been quite well, but nose & liver bad again, most cough & expect of thick phlegm - ℞ Pot Nitr with ℥ij Bromide of Amm c. mag. t.
29th Rochester, but has perversion & loss of smell now - Cough some & bronchitis -

104 Subglottic oedema, necessitating tracheotomy, good recovery, with an infantile voice, found to depend upon the remains of the oedema & absorption and cure -

James Creed aet 39 came to me June 2nd 1863 with a note from Mr J W. Nunn. Is a Border -

In august 1862 Mr Nunn performed Tracheotomy and a tube was worn for 3 months. He had been ill 18 months before the operation with laryngeal disease, with great dyspnoea & fears at times of suffocation. Cause not clear. Under Dr C J B Williams for some 9 months - & he has seen him since Mr Nunn operated on him - Previous to the operation he fell down in the street from dyspnoea & was taken to the Middlesex Hospital -

His general health is good in all respects, excepting his voice, which sometimes (when excited or anxious,) goes away & cannot get on = phonation in consequence - The voice is good although not strong, yet it is a little hoarse, tremulous & rough. He can raise it so as to be heard across the street, & could sing loud too -

Laryngoscopy easily done - Epiglottis very pendant - cuneiform very flat, but larynx could be seen by altering position &c - The sketch shows what was seen, the cords were narrow & of a dirty drab colour, below the

insertion of the epiglottis pastening the remains of a small mass growth could be seen, marginal distinct according to the deadness of parts of the inspiration - Everything else was pretty normal - ordered for the present to get up the epiglottis - Prognosis good -

℞ Am Bromid 3ij
Aluminis 3ij
Glycerin 3ij
Aquam ad 3vi
apply t. d.d.

I have no doubt that this was a case of primary subglottic oedema which increased during months & ultimately closed the glottis, requiring tracheotomy -

June 5th pulse better, but breathing persistent - little growth well seen - cords congested -

℞ Am Iod gr 32

applied Thomas' but any - voice tremulous - Pt Eagle -

8th applied Sol Cupr Sulph to cords - goes to Asylum to-day at Stanwood as Butler -

September 7th Took his bed 5 weeks - Voice is not so tremulous & shaky now, has hallooed & shouted out without any break or inconvenience. No growth now to be seen, but the cords are a little red & epiglottis partly pendant. Circ. x 38 Lowndes Sq.

Pt Mrs el Eagle - The improvement is decided -

Quoted in Ed 2

Dark red patches of the throat & larynx, probably syphilitic -

Mrs
Frances Bridley aged 48 - came to me June 4th 1863 from Mrs. L. Cooper - 10 Children - always healthy - 13 weeks ago I/d complained of sore throat, attributed to solution of a sawfinger probably inoculated with syphilis 2 yrs ago - Dysphagia was terrible & still continues - voice was once lost, but returned again, now it is excellent. The whole neck in front aches towards night, so that she feels as if she wanted to hold & nurse it. General health is good but she feels low because she cannot eat solid food well, especially bread - fluids can swallow easily - In swallowing solid food there is a crackling as if the food would not go down - Feels a constant dryness in the mouth and throat -

She has had the body covered with syphilitic lichen & on looking into the throat there are large dark purple red patches on the velum, inside the lips, side of the tongue &c -

Laryngoscopy showed the same depraved patches in the larynx almost proceeding to ulceration - the

dysphagia was produced by enlarged cervical glands on either side pressing upon the pharynx & oesophagus. Some little thyro hyoid tenderness, double -

The dark shading indicates the redness, & change to say where was stony -

In all letter to Mr Cooper, I suggested small doses of Iodide of potassium and Tinct of Iodine for some weeks - & the use of a paste of Bromide of ammonium & Glycerine -

Quoted in Ed 2

Mrs Francis, act 35, mother of 6 children - June 5th 1863
I examined about the chest & throat - when speaking much or laughing she suddenly begins to cough - No apparent Chest disease. The larynx was normal, & the tracheal rings were seen through the mucous mem of a bright bronze yellow colour the same as the epiglottis, which I may call an unusual circumstance - the canals met at a sharp angle which was remarkably apparent at times -

The right arytenoid cartilage, apex, was prominent & not uniform with the left, & came into contact with edge of epiglottis -
Decem 21st 1864 She had a sudden mild attack of Diphtheria, which had gone thro her family - ℞ ℥ j Ferri Mur, Acid dil, Pot Cl & warm to Gargles & brandy frictions at once checked it & next day 22nd she was much better -

1867
Aug 12 My y Red Mix for her Son Adolphus —

Follicular Disease with Extreme Irritability of the Fauces.

The Revd John Brown Paton, Indep. Minister, Sheffield - through Revd J. M. Conder of Leeds consulted me.
Whilst at College he was troubled with wheezing in breathing, an affection which the Physicians said was occasioned by enlargement of the glands of the neck pressing on the pharynx. By the use of Iodine & constant cold water this got better, & the wheezing entirely went away, & although his voice never recovered the clearness & force it had in his youth, it was fit for plentiful work. This winter he had a cough for 2 months; it became worse, and his throat was affected and blood sometimes was mixed with the mucus. The cough soon ceased under treatment & care, but the throat continued very bad. In addition, the stomach was much out of order occasioning violent flatulence which produced dull pain in different parts of the chest, occasioning chilliness in the small of the back with sometimes shivering in the night. Dr Elam of Sheffield said his heart was somewhat affected. In other words the mucous membrane seemed to be quite diseased, yet my strength did not give way

I eat well & walked well." Gen'l health is now much restored, he looks in first rate condition, but the throat is still sad & sore though much improved, stomach & bowels are getting better though not quite right yet.

Also particulars from his letter dated St Annes College Victoria June 4th 1863.

Laryngoscopy June 10th. Extreme redness & congestion of the fauces particular mucous membrane of fauces, pharynx & larynx, including that of the vocal cords & trachea. Ulcers of the fauces - patchy, tessellated condition of wall of the pharynx - uvula not elongated - All bathed in a slight thin watery secretion, which he can now & then hem up - Face flushed & dried - flatulence common - Applied Sol of Tannin fort to all the parts -

118 Phthisis Pulmonalis, 1st Stage, with Follicular disease of the throat.

Rachel Bassett, aged 20, a native of Kent, on June 6th 1863 came to me about her throat. She a pale, good looking girl, in service -

Has had a cough for 1 year, was better, but now it is teasing & hard & tears, all in the throat. No came for it - Catamenia regular - Lost 1 sister with Phthisis - Is very hoarse sometimes & if she talks much or laughs it brings the cough on - Subject to colds - Appetite good - returned from Ireland in September last & was home in Kent until Feb. Under Dr Druitt June 1862 for inflamed throat - Throat is dry at times - Palpitation on going up stairs - No pain in the neck, no dysphagia nor dyspnoea, sleeps well at night, back aches on walking or sitting much - Has many hard rubs & no relief obtained - Had Pod to chest & neck - Has aching at root of neck - Has taken Cod liver oil & steel with benefit.

Laryngoscopy - Relaxation of inner rim of Larynx & Fauces pale, with redness of latter & elongation of uvula - Trachea much Congested as far as can be seen - Commencing Follicular disease - In 1st stage of Phthisis - dullness in L. of chest sup., heart's beat

Swallowing one of the Bronze halfpennies of Queen Victoria by a Child -

Emily Stubbs aet 6¾ years, a pale child, with red hair was brought to me by her Mother Sept 18th 1863.
She was playing with a bronze halfpenny on Saturday 12th in her mouth when it went backwards and lodged in the pharynx for some 2 or 3 hours, instead of trying to get it out, she tried to swallow it, and it caused her much pain until it reached the stomach, apparently lodging near the Cardiac end of the oesophagus for a short time. She had not passed it up to this time by the bowels, & advised non-interference, although the bowels had not been open for 2 days -

122 Follicular disease of the throat & larynx — the Photographers sore throat — from the odour & Vapours of pungent chemicals.

Mr Finlayson, Photographer 62 Piccadilly, in 9th June 1863 Came to me recommended by Mr Rugg —
Has had a relaxed throat from a bronchial affection the result of a severe cold in the Princess' Procession some weeks ago (in March). Has been treated by Mr Fuller, Sr Garrett & others without relief & taken a great deal of medicine — Is a plethoric person, health otherwise good —
Laryngoscopy. The larynx, vocal cords & epiglottis, are quite red from congestion & relaxation, with some of the follicles like red dots; the fauces in the same state, very irritable, deeply red & in places have shaded from mucous denudation. Uvula much elongated & resting on the tongue. At times his throat has been very dry & his tongue dry as hard as a board — Towards afternoon & evening his voice gets weak, but he has a great amount of exertion & speaking & sundays in his harassing business —

t. i. d.
advised him to leave town on Saturday next to spend Sunday away, for he does too much work without change of air —
I applied Sol Tod Ammon in Glycerine to Larynx —

July 7. Last week felt quite well - of the ray a little
feeling remains, due to the warts -
Laryngoscope shows the larynx in a fine healthy condition, the
right cord quite white, & the left nearly so, the ventricles
remarkably distinct & dark brown, a little pulping of mucous
membrane below the left vocal cord; trachea very distinct &
quite healthy, rings remarkably clear, mem. membranes showing
their proper colour - Applied Sol Tannin to warts alone -
He brought me 10 Photos & 2 Vignettes, (2 coloured).
Came with Norduff, who saw the larynx himself - plainly
9th Owing to the great heat & work in his studio, the velum
& warts had become of a deep crimson, latter long, &
as his health was out of order, I
prescribed another mixture, &
applied Sol Nit Arg & dyed to velum.
Feeling of rags very marked -
15th Fauces now of a good pink, warts still long - Voice husky
to day from overwork in the great heat -
Applied Sol Nit Arg to fauces
& Tannin to larynx -
At last visit. & purple of 9th June -
21st Fauces & larynx in very good condition,
latter especially - Velum less pendant & warts
thinner & shorter - Latter rough feeling
still present. Sol Tannin to warts &
fauces.
At purple.

Aphonia, some irritation and burning of the throat constant raking of mucus; associated with a pendant epiglottis.

John Draykard aged 53, a Gainer - on 15 June 1863 came to me recom^d by S^r Greames of Cromwell Terrace, late of Edgeware Road. Is a native of Lincoln -
For 12 months cold after cold settled in the throat, cant get any rest night nor day, so for the 12 months. Not so bad till the last 6 months when he has been getting worse and worse. Last 3 months voice reduced to a whisper, sometimes if weather is fine he is able to utter a low voice. Health always good before this.
Is constant hemming & hawking & spit up phlegm & irritation of throat; real pain & irritation & burning sensation in upper part of the throat; is constantly trying to expectorate & he feels as if the phlegm came from his head; nose is rather stopped up. No dysphasia & can eat well, but great dyspnoea & expectoration, least excitement upsets him - Mouth very dry at night - Urine passed at night has caused sleep - No night sweats. P 100 weak. Ulcers deep & numerous at both sides of the tongue, & below it, also on left tonsil & fauces. They are regular holes in the tongue, & so for months, has

128

, sight & hearing affected

used alum for these. Laryngoscopy showed Velum quite flat & immovable a glottis. By uttering a forcible and continuous hoarse expiratory sound it was raised at intervals, & permitted a view of the larynx, on the right side of which was a deep excavated ulcer involving the true & false vocal cord. The cords were a dirty white, & not very regular in outline. Applied Sol Lad Acet to larynx pharynx, & tongue.

Urgent Dyspnoea at night, dysphonia, associated with Chronic Bronchitis, & Chronic Tracheitis, with subglottic congestion -

Mrs Harton, aged about 35, brought home 16 June 1863
by Mr C.H. Bencombe of 4 York Place, Bow Road, E.
Long subject to bronchial catarrh but her present complaint is independent of that, supposed at one time to be spasmodic asthma, but Mr B says it is not so.
She wakes up at night with cough & urgent dyspnoea & feeling of constriction about the larynx, with severe smarting & dryness of the throat; after a while expectoration follows & she gets relief. She generally feels soreness at the top of the chest, in other words in the hollow at the root of the neck in front, corresponding to the lower part of the trachea. Voice sometimes affected but never lost, dysphonia sometimes very great. Never hoarse - Is weak & susceptible to the slightest cold; health not generally good. This every for some years, but the throat symptoms are more distressing than they used to be - Acts as my nervous she bears the nurse very well - 2 children, 1 living -
Laryngoscopy. Larynx healthy as well as cords - Congestion of subglottic slightly, but greatly in the trachea

as far as could be seen. Inner lining of fauces excoriated in patches with filmy secretion. Tongue dry & fissured.

Follicular disease necessitating residence for 2 winters at Madeira and Mentone; most extreme irritability of the throat; perfect cure.

Mr Geldard æt 45 came to me June 20th 1863. lives at Cappleside, Settle, Yorkshire, and for the last 2 ~~years~~ winters has stayed at Madeira and Mentone. Two years ago he took cold after rheumatic fever and his throat became bad, what affects him chiefly is a desire to hem & clear the throat by expect., & then he is quiet. He has had influenza & ordinary attacks of Cynanche from time to time, but no serious disease of throat. & the last 2 winters he spent from home for fear the disease might settle in his lungs. Dr Crain & Dr Wms say his lungs are sound. Married wt 7 child. A damp close day brings on inclination to cough, clear weather does not. Always mild at the sea board, as a Coast of Yorkshire or Isle of Man or board of ship. Disease only lasts a few days at a time. Feels an uneasiness at the junction of the Hyoid with the Thyroid Cartilage. General health is good. Sleeps well at night wt no uneasiness. Slight impairment of action of the Heart from 3 attacks of Rheumatic fever, Dr Wms & Crain told him. Appetite wd large but good, digestion pretty good.

Drinks Claret for dinner – Has an extensive hemd & can
Throat not dry at night; no dyspnoea nor dysphagia –
Laryngoscopy shows most tremendous irritability of
fauces, with extreme contraction, relaxation & secretion
of all the parts, like Pearson & Corder – The exam-
ination therefore was not minute – Velum pendent &
resting against tongue, uvula very long & relaxed –
applied Sol Tannin to larynx & pharynx, in the
former it slipped down with ease –

Varying Aphonia, with semi-hacking irritative Cough

Lydia Bailey, act 58, Midwife, on June 23rd 1883 came to me from Dr H.G. Wright.
Was at Stellings Hospital 6 months ago for pulmonary disease & got better, but has had cough 2 months which is most harassing, for it is constant & hacking as if she wanted to bring up phlegm but could not. Suffers much from bleeding piles. Wakes at 2 am & cant sleep after; has enuresis-caught cold in her avocation. Puffed up with wind, liver & gin disagree, bad digestion. Always stuffy before last 12 months. About 3 weeks ago lost her voice, then it returned; early afternoon has hoarseness followed by Aphonia; sore throat as well my head especially at night, cant swallow with it; great perspiration followed by cold showers. The hacking, loud, dry cough is almost constant. Her med: causes expect of frothy mucus.

Laryngoscopy. Epiglottis a little pendant, terribly sore warm, & streaked with vessels, projecting towards right side. Action of cords irregular, the right acts well, but not the left, it is sluggish & partly paralysed, it is rough and

serrated with pustules & does not produce complete parallel rim ; its calamis altered. Throat is much irritated, follicles enlarged, & membrane relaxed.

Necrosis and Exfoliation of the right horn of the hyoid bone.

Mrs Adelaide Edwards, act 33, came to me June 29. 1863
No family. Ill 18 months. Passage between nose & throat appeared to be stopt up, & a feeling of creeping about the roof of the mouth. That subsided, & was followed by tickling in the throat & great debility. Headaches frequent. All originated from a cold with deafness. No dysphagia nor dyspnoea, but feeling of oppression about the chest. At first had difficulty in swallowing fluids; always better when eating. Can breathe freely thro nose. Is nervous but has been taking steel from Mr Cutler. Had disease of left Tarsus of Cowen joint when a little girl, but has been well since 16. Much deformity of side of face, & below the chin & on neck. The right horn of the hyoid bos probably exfoliated, it cannot be felt. Voice perfect. Laryngoscopy. Larynx normal. Some ulcers of the pharynx. Roof of the mouth deep & narrow. Stammers habit. Epiglottis not easily seen —

Short notes

Fracture of the pomum Adami when a bony, irregular (and) [crum] sharp prominence in the neck -

John Collins aged 19, in 3rd stage of phthisis, presented himself June 10. 1863, the pomum was as prominent and sharp as if a specimen of bone, the sides were irregular, & somewhat narrow, & the larynx had became equally so - This was shown on laryngoscopy for the lateral walls of the larynx & cords seemed oppressimalent & elongated - The voice was sharp & shrill yet feeble from the phthisical disease - Of course no treatment could be of avail here, but the lad had sustained some injury when very young, of which he could give no account - This patient was shown to some of the pupils - He was admitted with phthisis under Dr Basham, per me - examined him again Aug 14th -

8 years old, for by smelling & an abscess on eye of an adult, who burnt - he got better - Had haemoptysis later -

Laceration of the epiglottis and old laryngeal disease, the result of syphilis -

Joseph McDonald aged 27 - a Green Coat Boy, Parish of St Johns came under me June 1st 1863, lately under Dr Basham - He was fearfully scarred about the face from the ravages of syphilis, which had in a marked his throat also, for the uvula was gone - He

spoke in a nasal twang: He had been ill 5 years off & on with sore throat and pains about the body, and had been 4 years attending this hospital under both Mr Hellman & Mr Fincham -

Laryngoscopy showed the epiglottis to be quite flat and pendant hackmatic so on the glottis that the interior of the larynx could not be seen - If he was not a good subject at this moment - Rhinoscopy showed ulcer at the back of the pharynx extending up to the roof of the pharyngo-nasal vault - The eyes of this patient were remarkably clear & brilliant & circles blemish -

Quoted in Ed 2

Aphonia ~~a~~ off for 2 years, atheromatous concretion of both cords, with loss of substance posteriorly -

ad. June 16th
an elderly woman, Mary Ann Marks, aetat 47
I examined for Dr Fincham on the 20 June 1863 with the laryngoscope. The cords were seen to be short & narrow, of a bread yellow colour, streaked with brown, their (posterior) free margins long ulcerated away, so that on endeavouring to utter a sound which could not be effected, approximation was irregular & incomplete like the sketch, and the ~~air~~ air passed through without resistance. The prognosis therefore is bad. I suggested use of Iod pot & Tr Iod internally, & use of Sol Nit Arg locally - She was from Dewsbury & sent in by Dr Hamilton Robt - Her whisper was almost inaudible

1 July Examined her again by sun light - & again subsequently & showed the H. how to apply Nit Arg Sol -
17th Says by sunlight - great improvement, cords whiter & more approximated - whispers louder - space smaller behind -
28th About same, but has terrible spasmodic attacks at night - Dr Fedeli
Aug 15 Tracheotomy performed a few days ago, by Hewett, with best results, I saw her to day - No suffocative attacks since, but bad bronchitis -
Oct 10 Has spoken quite well several times with the tube in - Examined her to day & saw the silver tube quite plain, & showed it to a number of the

See page 159

Destruction of the Epiglottis, and arytæno-epiglottidean folds with disease of the Vocal cords and trachea; also adhesion of the Velum & Uvula to the pharynx; and destruction of part of the nose; all from Syphilis.

This was an in-patient under Mr Hall's care who had been treated for Syphilitic laryngitis &c- and was examined by me on July 1st 1863, in the presence of Mr Heath & Mr Gandy the House Physician. The ravages of the disease were extensive. The epiglottis was gone, and the greater part of the arytæno-epiglottic folds, the latter forming irregular tubercles as seen in sketch a. The Vocal-cords were degenerated, thickened, irregular at margins, but not destroyed; they acted & left a narrow glottis. Below the mucous membrane of the trachea was ulcerated, thickened, red and swollen, giving rise to the croupy occasional cough - Arytænoid cartilages were sound. The velum & uvula were almost wholly adherent to the pharynx, a small passage only existing at the extreme point of the uvula, as per sketch b.

There was much sensibility in the fauces, nasal voice & dyspnœa, from this - Ordered taking Hyd Cl & Iod Pot. I prescribed a gargle of Br Am alum Glyc & Water -

154 20 Oct He was lately readmitted, & was under treat of Iodpot & Bath pastes, which he got drink & went out of his own accord 2 or 3 days ago - Quoted in Ed 2

Specific ulceration of the larynx, with aphonia in a young married woman; paralysis of left cord

On 4th July 1863, I examined a female patient for Dr Radcliffe, who was labouring under secondary symptoms, & aphonia - The tongue was covered with denuded red patches, here & there. I examined her in the Hom Physns room & in his presence - The aphonia was said to be of 2 months duration. Laryngoscopy showed the right cord narrow & white, the left not distinct from redness & ulcer of it, the false cord & arytæno epiglottic fold & the boundary of the larynx, the ulcer possessed a distinct red margin, & was apparently indolent in character. The aphonia was explained -

7th July Dr Radcliffe told me had examined her & found what I represented. & he mentioned a case of acute laryngitis he had examined also, but too far advanced to escape Tracheotomy.

Quoted in Ed 2

Acute Laryngitis, with supra-glottic oedema; spasms; tracheotomy

James Mowbray ast 39.

This was a patient of Dr Radcliffe's / in whom he saw the acute redness & oedema wh the mirror. As attacks of dyspnoea were frequent & dangerous, tracheotomy was performed.

I exam[d] him 28 July 1863 with Dr Fedeli of Rome.

The inflam[n] & swelling had so much subsided as to permit the canula to be seen of a dirty grey & irregular border. The false cords were also much swollen. As the tube was sucked, I made him deeply inspire & the glottis opened like in 2. The tube therefore could be removed with safety.

1

2

There was a touch of syphilis here, he had been ill 6 months before the operation. 31st Exam again wh sunlight, in presence of Mr Hallhouse, Dr Fedeli, Mr Gandy &c. The tube was taken out; a little loose body was attached to the right cord, but not in any view — 15 Aug Sub glottic contraction going on, as seen by day wh Mirror. No dyspnoea. wound in neck cicatrised.

20 Oct Necrosis of cartilages going on, glottis now nearly closed — Prognosis bad for recovery of good voice —

13 Nov Necrosis stopped, and marked improvement in general health. Can now speak with his finger on the tube. The glottis has much improved and is opening wider, but the cords are pink — Quoted in Ed 2 —

22 Dec I exam[d] him & saw the silver cannula, with  Mr Tenck & others — See page 159

Aphonia of 3 days, from Inflam^n of the Mem. conj. the Vocal cords – Paralysis

The patient was a female, who came on 28th July 1863, with aphonia & hoarseness of 3 days, attributed to a cold – Laryngoscopy showed inflam^n & redness of the M. M. conj. the cords, with almost complete paralysis. Sol. Nit. arg. applied with a brush, with the aid of the mirror in presence of Dr Fedeli of Rome. and a R[illegible]

Remarkable Case of Gout affecting hands & fingers, and the Auricle of both sides –

~~July~~ 21st 1863 – was admitted as an in patient, I examined him with the Laryngoscope & found the epiglottis quite pendant – voice always has been good, but I wanted to see if there were any deposits in the Larynx.

Jane Hawse aged 37 sent to me by Dr Wright Sept 26. 1863
Had sore throat for 2 years, syphilitic - much ulcerated but
now healed - Brings up much thick expectn mouth parched
& dry at night & on waking - not so in day - No dysphagia.
Has had pains about the neck but not now - Head bad
& chest also as if a sack of weight - Has had periosteal
pains all over - Has a constant sense of heat as if at
back of throat - Had been examd at Middlesex Hosp
with the laryngoscope - Wright called it an obstinate
throat case, with syphilitic taint, & sent me as an O. P.
at Westminster

pupils & visitors. See sketch. The right vocal cord was visible quite distinct but not the left so well. Sun light used.

13th Showed the case to Dr Davison of Paris & others. & it was so beautifully distinct & shiny that we could see the small opening on upper surface of tube, thus

20th Showed the tube in the Laryx to Dr Jenkins, Hallhorn, Heath & others. As she could wear no double tube for the irritation of the Laryx, & as all the parts were clean above, I advised the removal of the tube & let the wound close up, & if there was any return of the spasms, to perform tracheotomy this time, which was acceded to.

30th The cords & Laryx have resumed their old appearance & there is a tendency to the return of spasm. They are whiter than they were at first. The opening has not quite closed up.

Dec. Tracheotomy beautifully performed by myself at the house. with a double hook. for the increase in the spasms. The operation was completed from first blast within one minute, including the incision through the skin & introduction of the tube. Indeed in performing these operations with a rapidity & dexterity I have rarely seen equalled & never surpassed.

8th Doing very well. 22nd Saw tube in mirror. Quoted in Ed 2

12 Jan 64. No more spasms. Is quite well, she spoke in an audible tone & putting her finger to the tube. She is stouter.

9 Feb. New tubes now fixed & she spoke quite loude & we

and is cured of her dyspnoea, but must wear the tubes permanently. Oct 11. 1864. Is quite well & has been so, & is anxious to get rid of the tube. can speak with finger on it - Can always eater, chewed all normal & tube was removed - & she speaks loud & well at times. e.g. 25th. The intermission passing was not quite fair voice -

Aphonia for 3 months from ulceration of left Cord

A woman aged 37, presented herself Dec 8. 1863 with Aphonia of 3 months; she had chronic bronchitis, was intemperate, and said she was going home that day all the way to Hastings - On examination the posterior 1/3rd of left vocal cord was found destroyed, by ulceration, which extended down the trachea & sub glottis - The other cord was white & normal; & so was the remainder of the affected one - The case was shown and explained to the pupils present -

---

Continued from page 155

He was attacked with pneumonia, and brought into the Hospital marched on April 4th 1864 and died April 5th - Both lungs affected with pneumonia at p. m. and a piece of ring of cricoid lying loose in the larynx, with evidences of old disease of the larynx - Exhibited before Path Soc May 3rd. Spleen diffluent -

160 Chronic Laryngitis, Syphilitic, with loss of right Turbinated Bones, and Vomer.

1863
Eliza Flitcher act 36 - admitted Novem at Westminster Hosp - for chronic Syphl Laryngitis -
10 years off & on with Sore throat, but 6 yrs ago lost nasal bones & a great hole exists at top of the nose perforate - Has now chron: laryngitis, cords ulcerated, thickd & inflamed & thickening of the epiglottis - Yet she is able to speak was - has a hoarse laryngeal cough - Oval hole in ant: part of hard palate size of a 6 - Communication of nose is perfect - The right turbinated bones, & the vomer are gone, and in swallowing the velum is seen bare in the nose - Left turbinated bones, & floor of nose perfect above - Exam'd at my house Dec 14th - back & front - I shall hand over to Dr Sieveking with a note, & number 7/-

25 Jan 1864 another view - a portion of the right Sup^r turb^d bone is left - fleshy swelling at right side of septum only connects to the inf: turb: bone - a small bridle of membrane runs from top to bottom behind, when the septum was Had a view also from behind the velum -

March 18th Voice smooth, soft & melodious - no hoarseness nor roughness

Novem 22 Lives at 21 Wood St, Millbank St.

Continued Vol 7. p 215

Construction of the entire trachea and large bronchi with thickening of their walls, associated with fetid growths in the larynx; tracheotomy, inability to get in a tube; fatal result

---

Charles Robert Montague aged 20 applied Dec 18 & 1883 with a letter fr Dr Thorowgood, under whom he had been at the Victoria Park Hospital. He said the case seemed rather an uncommon one except the laryngeal symptoms. Has had inspiratory stridulous breathing 12 months, (but was quite well before that) with cough and great difficulty in expectorating phlegm. Has lost his voice several times for weeks together, from colds &c. No dysphagia but great dyspnoea at night. The laryngascope showed a swelling on the right side, fm sketch

22nd Was admitted as an in patient to day & I could see projections at the back of the larynx like warty growths, possibly syphilitic, as the nostrils were also ill.

29th Made another examination in the presence of Dr Gandy, the House Physician & others who saw the swellings -

January 1st 1864. He was suddenly seized with dyspnoea in the night and Dr Walthouse performed tracheotomy at 4 Am, but no tube could be got in. When I saw him at my visit, 8½, I used the scissors from above & must have detached a portion of the growth, but the lungs were so solidified that the dyspnoea was now pneumonic. We passed & myself tried tubes in the trachea but they cd not be retained, from constriction & irritation, nor could they be got in from the same cause -

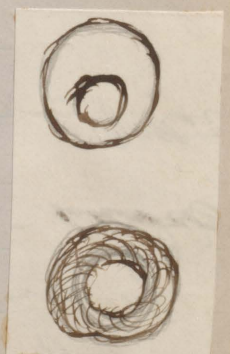
He died at ¼ past 9 pm chiefly from asphyxia -

P. M. on 2nd 17 hours after death -

The lungs were engorged with blood, with a few scattered tubercles here & there in the first stage. The liver had one or two small white nodules on the surface. The genital organs appeared natural, as well as the other viscera. The tongue, larynx and trachea were removed and carefully dissected afterwards by myself -

The epiglottis from its root half way upwards on either side was occupied by a number of flattish fibrinous bodies, which partook of the character of

months, 2 or 3 the size of small peas
were found in the right side of the
larynx involving the false vocal
cord, & unseen during life —
The ventricles were unobliterated, and the larynx
was unobstructed below the vocal cords; the
mucous folds everywhere, but especially the arytæno
epiglottic were very loose —
The trachea was greatly thickened, and its
tubal
diameter much contracted. The anterior
walls about its middle were ½ an inch
thick, thinning upwards, but less so
downwards. This thickening involved the
right bronchus & slightly the left.
About ½ an inch from commencement the
contraction began, & below the wound
its diameter was ⅓ of an inch & this con-
tinued nearly all the way to the bifurcation,
where even the walls were 2 lines thick.
The diameter of the left ~~lung~~ bronchus, at its
commencement was about 2 lines, & its
lining was intensely inflamed with small
ulcerated patches the size of peas —



The rings of the trachea could not be distinguished from within, but the whole interior was irregular and topped [illegible] fibrinous deposit -

Complete Pendency of the epeglottis ; Congenital probably. with characteristic symptoms.

Thomas Barley aged 30, hairdresser, admitted 5th February 1864. Hoarse with a shrill voice when a youth. Feels as if a nut was constantly in the throat, at times producing much irritation, cough, & discharge. This depended upon the epeglottis which lay as flat as if pinned down. It was immovable. These symptoms had existed for 5 years, [illegible] otherwise good. Treat heretofore nil.

By ordinary astringent & soothing gargles did a little good, but

on 18 March I put him on Am Bromid ℥j Aquam ℥iv

with aphonia - was out selling Radishes on 5th
inst. wet and next day lost her voice, & has had
aphonia ever since - Bad cough as well & headache.
Acute Chondritis is present - Shower bath &
Mist Pect -

Worms from the nose & frontal sinuses -

Maria Blackburn aged 11, was admitted 15 April 1864. For some 3 months she has complained of pains in her head & frontal sinuses and Chest. On the 12th the nose swelled and a discharge came from the nostrils; on the 13th the face generally was swollen & red, like erysipelas which was reduced by applying flour. To day 3 or 4 worms came from the nose, about 1 inch long, & as fine as threads; they curled up immediately. This morning I passed from the right nostril which was lost to me. Has much itching & tingling about the nose & now ~~the~~ there is ulcer & scabbing of the sides of the alae. has a cough as well.

19th admitted to day in patient - passed none since but very delicate nose to be syringed out with warm H.O. ℞ Zi Fer mx / aq Menth Ejs. t.

May 3. Genl health much improved, has passed no more worms, but the headache over frontal sinuses is constant.

7th left the hospital to be out patient -

Follicular Disease following Bronchitis, speedy Cure -

The Dean of Gloucester consulted me June 30 to 1863 for sore throat, having come up expressly for the purpose. Aged about 65. Till the autumn of 1862 he had good health when he was attacked with Bronchitis - His voice has never been good since, being hoarse, rough, & feeble. He got better & better in the Winter & in the Spring commenced to work. The slightest cold flies to the Windpipe and if he preaches it causes the voice to become feebler & feebler. The voice might be good for a week or so, but if he talks much it influences it at once. Voice used to be very good before his illness. No cough at night - No expectoration when well, but if inflamed think a little in morning - A little slimy expectoration occurs after much talking. Laryngoscope. Nose seem of throat a little relaxed, congested & steady - The mucous of the Larynx much congested, but pretty so in the trachea pretty for downwards, which is the chief cause of the mischief, especially at the subglottis - A little ulcer on the left wall of the pharynx - applied Shower bath over his throat -

Incipient Follicular Disease quickly checked —

The Revd Geo James, aet about 26, on 30 June 1863 came with the Dean of Gloucester. He was subject to general relaxation of the fauces & larynx, from excessive work; the larynx & cords were much congested & follicles enlarged — This had been for 3 or 4 months only. Applied Sol Tannin to the fauces & larynx — & ordered a gargle only — Ry Am Bromid Dij

Mr Wm Hunt, act 55, came to me 30 June 1863
recom'd by Mr Penny of Poole in Dorset. Has been a
local Wesleyan Preacher for nearly 40 years, but has
never overexerted the voice. Says he is not a Ranter.
This he has been obliged to give up more or less since
Decem 1862, but did preach 3 months ago.

Since Christmas last he had a bad Cold & was hoarse
it went off but returned, & has continued to the present
time. Voice has not lost tone during that time.
Has suffered all his life from indigestion. 2 years ago had
bilious attacks every 2 weeks, but none since last
October 12 months. General health good, no cough,
dysphagia nor dyspnoea. Gets fatigued from
talking; no pain unless the voice is distressed.

His voice is decidedly hoarse and peculiarly
husky, though not weak, it is rough as if phlegm
was mixed with it, often feels as if there is phlegm
& a little hem removes it, but expectorates none.
Used to sing psalms, but not since his illness.
Laryngoscopy beautifully explained the symptoms.

for they were found to depend chiefly and mainly upon a small swelling or tumour of the right side, as shown in the sketches. Fig 1 represents the natural view, & 2 that on forcible inspiration when the epiglottis is drawn upwards, & 3 the growth separate with a sort of dble pedicle. This moved forwards & backwards according to the position of the epiglottis, & seemed to originate probably from the base of the cartilage, or in its proper fold. There seemed a disposition to the formation of another on the left side, but not shown in the sketch. This explained a feeling he had of something moving or slipping in the throat, & as if he wanted to swallow something. The voice was never lost, because the cords were not interrupted in their action. I incline to believe that this tumour is formed by detachment of one of the smaller cartilaginous bodies, such as that of Santorini. The arytenoid cartilages were quite normal.

Applied sal Tannin to the tumour

I told him that it would be necessary to remove it, and that he must come up some day with Mr Penny for the purpose - 3rd July wrote to Mr Penny - & on 21st also to say that I should be out of Town on 5.6.7 Aug & on 24 Aug & 3 Sept August 1st I rec'd a letter from Mr Pendry stating that Mr Hunts friends were so adverse to his undergoing any operation for the hoarseness without having a second opinion that he went up to London & consulted Sr Johnson & Sr Hyde Salter who both said that they could not discover any tumour; had either confirmed my diagnosis, Mr Penny would have come to me with a medical friend to have had the operation done - But as they have differed from me, Mr Hunt has concluded to leave it to rest & nature for a time, & he wished Mr Penny to mention this.
I wrote to Mr Penny thanking him for kindly writing the above.

1869
Febry 6. In the Times of to day, amongst the deaths, was

"On the 3d Feb. at his residence, Coppleside, Settle, Yorkshire, aged 51, Christopher John Geldard Esq."

1870
June 14 Mr Haddock from Hellifield near Settle, told me he died from dis of heart a few days after only 3 or 4 days illness. It was not from his throat - he was well of that -

Major London, St Helena Regiment came home July 2. 1863.
aged 40, stout, now 5th W. I. Reg atheromatous expression,
fatty eye & face - Had come to England on purpose to consult
me by the advice of Dr Fowler, the Regimental assist Surgn -
Abroad many years, most of time at St Helena - although
robust is nervous. Has had affection of Windpipe since
July 1862. E. L. & other treatment by Colonial Surgn at St
Helena & Dr Fowler. E.L. left open in neck for weeks -
Sponge & nit Silver, & tube passed down - 1 month ago it
returned? Still feels now the same smarting sensa-
tion in the throat which sometimes becomes burning -
No dyspnoea, cough nor dysphagia - On right hand
side he feels it and also downwards - not worse at
night. Voice powerful & wholly unaffected, but
becoming unpleasantly affected - He ceased speaking for
3 weeks but it had no effect. Has a sort of burning
feeling in the back & right side of the neck - Not
subject to Rheumatism - General health good in other
respects - Sore throat always when at home 2 years
ago. Had Influenza & Bronchitis at St Helena last-

sepnd to Jul, 62 ; tis a relaxing climate.

Laryngoscopy. Fauces a little vlazed, uvula long & pelat. few patches of superficial ulcer in pharynx, with red edges - Larynx quite normal as well as vocal cords - Inner. mem of trachea most congested reddened & a little pulpy, & no doubt the cause of his complaint. This extend fast down. No sensibility of fauces examination very easy - Shower hot air -
& brush of do to fauces -

Pains in chest & neck. To rub chest & neck

Ulceration of the false vocal cords, extending to the root of the epiglottis, and also its apex, & threatening the true cords; complete healing & granulation.

Miss Dixon, act about 32, brought to me July 4th 1863 by Mrs Sankester. Is employed as a governess, & was on her way to the continent, Coblentz, with a family this day.

Has had hoarseness 2 months, with a little cough following an attack of bronchitis. Continual irritation in throat and pain in either side of the neck. Voice feeble at night. Constant expectoration. no dyspnoea nor dysphagia. a little soreness at top of neck. tis an exertion to swallow but not a pain.

Of full habit, muddy complexion, but with a cough & hemming of irritated throat.

Laryngoscope showed extensive & active ulceration on either side of the glottis near the epiglottis, affecting chiefly the false vocal cords, with a disposition to involve the true. The apex of epiglottis itself was slightly affected. All showing the necessity of active treatment to stop it, else the voice might be lost. She remained actually aphonic.

194 Weakness of Voice and chest with a strong phthisical diathesis & family history —

Ebenezar Jane Tatman, aged 18, came July 8th 1863 to consult me from Harrow. She assists her mother in a school. She teaches singing as well.
Suffers from accumulation of phlegm since last Christmas, no cough, but makes her feel sick sometimes; it comes also occasionally when not feeling very well; principal in the morning on rising. No dysphagia but a lump of phlegm is constantly in the throat, rather black? and thick. General health is delicate, head aches frequent, is nervous, appetite bad; catamenia regular since 13; relations not phthisical, her mother died of Phthisis, father was phthisical & died when she was a mere child. Only 1 brother aged 19, with fears of decline. Is not stable & cared, health good in other respects; no soreness in throat. Has had trouble of mind. Suffers from Indigestion & weight of the chest. Starts in her sleep. Often drowsy. bowels regular. tongue clean pulse weak. Voice is good, but expectorates after singing. There is a catching in the throat sometimes, & it often makes her cough violently. mouth very dry in morning

has not been free from the phlegm ½ an hour since it came on, this mostly pretty - Recommended to use by the assist of Dr. at Lyte there -

Laryngoscopy shows: Mem of larynx relaxed, & a little pulpy, cords narrow & unduly def arated - applied Sol Lad acy -

198 Reduction of the epiglottis to a mere stump by ulceration; tracheotomy; inspection of the glottis from below.

I. Connor, act 30, on the 10 July 1863 I examined in presence of Mr J. W. Stamm & Mr John Wallis Mason of 45 Upper Mary Lebone St, at Balconer St. Laryngotomy had been performed by Mr Stamm on 28th June for threatened suffocation, & they were now anxious to know the state of the parts - He had a tube in, & could speak pretty well with a nasal tone, & could breathe with his finger on the tube -

Laryngoscopy. Showed a great bilobed bright pink fleshy swelling, which seemed to be free, & likely whether remains of the epiglottis or of oedema of the right false vocal cord. The epiglottis in its natural state was not to be seen, nor could its stump if gone - The left true vocal cord could be seen as in a, & the aperture of the glottis. I advised the removal of the silver tube which was done at once, and the glottis was more expanded during sudden inspiration as in b, the left vocal cord being seen more distinctly still.

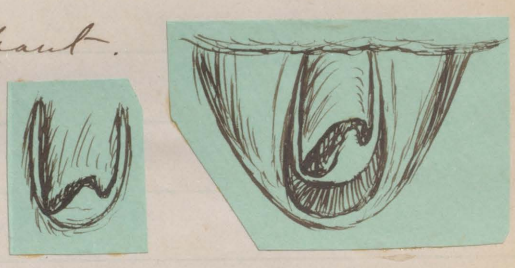
I then used the small steel tracheal mirrors, and could

respiration below upwards, this (O), the dark space representing the fissure of the glottis with space quite sufficient to breathe with comfort.

The patient was adherent to the pharynx, to the extent of its right half, and he had just recovered from a severe & dangerous attack of Cynanche syphilitica.

Septem 14. Wrote Dr Mason to send me the patient to examine some morning, if up and about.

17th He brought him to me, looking very well with the wound in neck healed. He spoke thick from the almost closure of the passage at back of the mouth. Saw & showed that the red fleshy swelling formerly seen was the remains of the epiglottis, one perfectly pendant & sunk away in the larynx so that the cords were wholly concealed. The arytenoid cartilages were gone, and an easy view was obtained of the inner wall of the posterior part of the larynx. There was little or no motion of the remains of the epiglottis, unless forcible hemming. Dr Mason promised me the notes of the case. 2 views are given of the larynx.



Inserted in Ed 2

202 Follicular disease of fauces, larynx and trachea, with great irritability; cure in 3 weeks. —

Mr Price, æt 23, came to me on July 14th 1863 with Mr James Edwd Mathew, Surgeon, of 1 Elvaston Place, South Kensington. Is a Student at Law. Had sore throat for 3 months, in good health before that. Lived at Caermarthen & Cardigan. Obliged to take a good deal of exercise for his health. No doubt Complaint commenced in a little Cold & indigestion. Had SO_3 & Steel & cure since he got well the neck has felt bad.

Feels a pinching on either side of the neck, a continual pressure as if something was holding the parts, in a line of thyroid bone & upper part of Thyroid Cartilage. (No dysphagia.) 3 months ago he felt this at the back of the tongue. One surgeon told him it was from smoking, but has been a smoker for years; breathes easy, no dryness of mouth, sleeps like a top. Health good in other respects he says. This morning had not much of this sensation, but now it's coming again, is not 5 or 10 minutes without it. A few days ago he felt stiff in moving his neck

chant. Eyes conjunctivae aroused & relaxed -
Laryngoscopy showed extreme irritation & congestion
of the fauces, velum & uvula, so much so that he
could scarcely bear the mirror - This condition per-
vaded the larynx & trachea; the vocal cords being quite
red, & sub-glottis crimson & follicles enlarged & pouring out fluid.
extreme irritability, but ordered Applied nothing for the

Quatuor in Lact 2

Miss Anna Penny, act 56, came 15 July 1863
Recommended by D Turrage of Wincanton
Somerset.

Ill 4 mos with a throat affection; it commenced with bronchitis, & affected the voice especially in the evenings, at first losing it altogether especially in the evenings, but not lately. Sets hoarse at night. The throat was ulcerated & the cervical glands enlarged on each side of the neck; my laye ulcers she says were on left side of throat, touched ones day with a sol of Caustic. Spat up a little blood 7 weeks ago -
Has had all kinds of chest complaints for many years - but general health has been pretty good nevertheless.
Is very nervous, especially because a sister died of Cancer, & she was afraid her complaint was the same. This she told me after my exam[n] & prognosis.
No dysphagia pr food, but the act or motion of swallowing is painful or sore - Has much phlegm in her mouth; no dyspnoea, but a sort of tightness at the root of the neck, relieved by 3 blisters - pr[s] pr[n] cough

just now.; sleeps well. headache occasly - much talking attends 2 deaf gentlemen, and this affects her voice -

Laryngoscopy showed a fine larynx, with feeble action of the cords, and not perfect approximation in uttering sounds - The treatment for down right side was repeated & the cause of the sensations in neck.

Applied Sol Faradic & galvanic -

℄ mag. ℞ bis die m

I gave a good prognosis, & cleared her mind on the subject of cancer, & approved of Dr Surrays treatment who I told her, & her 2 female friends, had very well managed her complaint. She looked like a married woman with a family, altho single -

20th Voice is certainly better, but is tired from sight-seeing. All symptoms generally improved - Cords much more active, tracheal redness less - much less expectoration. Applied Sol but dry with a brush & laryngoscope - leaves tomorrow for the country homewards. Vomica -

Follicular disease and Great Irritability of the throat - good case.

The Revd J. F. Ravenshaw of Wilts. July 15. 1863
came to me recommended by our Thos Hunt of Alfred Place, Bedford Square, who was treating him for Lepra - which he has had for 2 years. Aged
Has had a tendency to sore throat since ahay but latterly it has become very troublesome, and last Sunday he broke down in the pulpit. He gets husky, tries to clear the throat & then it brings on a paroxysm of coughing. Is not usually subject to cough, but has an irritating cough during the day. Voice has never been lost, has been hoarse sometimes for days, unless the throat can be cleared. The tone of the voice sometimes changes. He has to chant the service - no pain in neck, nor dysphagia, nor dyspnoea, but always a discomfort at the root of the neck; and not unfrequently a little pellet comes up & gives relief for an hour or so, & then he is troubled again. Sleeps well at night, very choky in morning, often coughing for 10 minutes to get the tubes cleared - General

health otherwise good.

Laryngoscopy. Extreme congestion of the fauces, velum & uvula, & very great irritation, mirror borne but a few seconds at a time, yet I made out the state of the parts. Muc. Mem. of Larynx, vocal cords, and trachea quite red & swollen, follicles a little prominent. The disease appears to be generally follicular - Applied Sol nit arg to Larynx with brush, which made him very uncomfortable for a short time - Even the mirror caused retching -

My said Lord &c xxiv
die in fil xxiv Exit Lent Dij
1 fil his die — Peter Glynn & S.

Spasmodic Stricture of the oesophagus, dysphagia with solids low down, but not fluids.

Captain Isd Howard Grant, aet 71, came home July 15th 1863 recommended by Dr Barnes of Kings Road, Chelsea. Is a fine hearty looking old man, has been a great Traveller. Lived last 20 years in London, but is just now at Deal. Was in the Mercantile Marine.

12 months ago had bronchitis and bad throat, but he got quite well. He has had Rheumatism for 2 years, & is quite lame, without any pain. He toddled in with an assistant.

He feels a kind of stoppage in the chest, and can not swallow bread, meat for 6 mos, nor indeed anything solid; he can eat Sago, arrowroot, soft of an egg, cream, soup, wine, Hinds & &c. but nothing in the shape of solids for last 6 months. Fluids sometimes produce the sensation of solids if not taken very slowly, & then he is all right. Sometimes there is a little uneasiness between the shoulders in swallowing. The sensation is felt in an old boil cicatrix a little to the left of the lower part of the sternum, & no doubt is in the lower

part of the oesophagus - S.B. Barnes believed me introduced a tube down as far as the obstruction, & he & others looked upon it as spasmodic. He, S.B. used inhaling Hot water with a sponge & 2 or 3 drops of Ether on it - Health Perfect in other respects; sleeps very well - has had much cough in the morning, but not painful paroxysms; cough produces inclination to vomit - voice always good & strong -

℞ Am Bromidi ℥j gr iv
Tinct Cinnam ℥ss

But even the lameness is better from the medicine. The oesophageal spasm he says is not so low down as it was. Still confined to fluid, or nearly so, food. In the Times of Novem 14th his death was announced at his sons residence Middle Deal, Kent, on the 9th Inst, act 73, much beloved & respected. The stricture no doubt had become malignant.

— Quoted in Ed 2 —

Miss Murdoch, act 60, came to me Novem 14th 1863 ref by Mr Stewart, dentist, 112 Cheapside.
Lives at 2 Lancaster Gate. Is very nervous.
Has had irritation of throat 12 months, and an ulcerated throat 1 month ago; in the morning she retches & sometimes expectorates with blood, & in pieces occasionally.
Has been delicate with her spine, & she said possibly her bed might have had something to do with it; her limbs were useless for 12 months. Not usually subject to cough but had bronchitis in May. Was under Mr Bryant & Dr Brown-Sequard. Has been getting a little better lately. Laryngoscopy very difficult owing to her resistance. She had to be held at her own request, and some redness

Mr Norris, ~~Hoothorpe~~ West Norton, Thetford, Norfolk, Executor & Trustee of Lord Hastings property. on 15 July 1863
Came to me - aged 64 - in appearance of the most
perfect health - Subject to cough for many years,
said to be due to an elongated uvula, which was
removed by the late Mr H. C. Johnson of Savile Row
but it rather increased the cough - From its rise
since, he is sometimes seized with uneasiness in
the forehead & down he falls to the ground at
once - & has sometimes cut the back of his head - He is quite helpless then -
This is usually preceded by sudden dyspn
nœa and difficult expectoration -
His lungs are sound, was told so by Dr Quain &
Dr Williams, who told him the disease was in the
windpipe & throat - Has spent the last few
winters at Nice, Rome, Pau, & Torquay & with
benefit. At the last he purchased expressly for the winters a house & lives in
Expectoration is thick & sometimes white & frothy,
or is dark - This fine warm weather suits
him exactly, & he is better now. His head &
head collects in his throat & is coughed up after
a while - Last thing he took was 10 gtt of Chlorice

ether. He thinks he is asthmatic. Is very abstemious drinks nothing but sherry & water - Has learned his complaint was dangerous, but Johnston said not.

The most striking feature, is a loud barking cough every now & then followed by expectoration - Laryngoscopy Showed a congested, highly so, state of epiglottis, larynx, cords, & trachea, which condition in a slighter degree pervaded the fauces - Uvula very low, conceals the pharynx -

Applied Tannin wh benzoat to fauces

Pt one of the former puzzles -

Aphonia for 6 months, wholly functional, cured by metallic showers, and one application of external galvanism —

Mrs Williams, act 47, no family, on July 16th 1883 was brought to me by Mr T. C. Sharp of Kensington Gardens Square, Bayswater, her brother. Recom'd to me through Mr Jabez Hogg —

Invalid all her life time, widow some years. Has lost her voice since January last, except for 1 week when she was thrown out of a chaise & the fright caused her to speak out at the time, & it continued for 1 week & then went away. Several years ago had a sore throat, and she has had attacks of spasm as if she was going to be choked; had much dysphagia when first ill. Has lived at North Zeal, near Dartmoor in Devon, and under Dr Christian Budd. When at home is out of doors all day long — The doctors all said if she could get her natural strength she would speak. Has wonderful spirits & a great many friends. Much talking causes pain in right side of middle of chest anteriorly; has a little cough but no expect^n. Dr C J B Williams examined her 2 years ago, and said there was a little thickening & congestion

in upper right chest, but nothing serious.

Speaks in a low almost inaudible whisper, but a little excitement causes the voice to become louder. very weak, no appetite, can scarcely a mouthful of bread. Sudden emotion or fright causes dumbness for a few days.

Many years ago she had uncontrollable sickness & constant vomiting which nothing would allay; she took a sea voyage to London, & it perfectly cured her.

Laryngoscopy was unsatisfactory from the resistance of the muscles. I saw the epiglottis, thick & red. had a very imperfect view of the larynx. applied a hot cup sponge, & ordered for the present.

advised use of voice by forcing out high notes —

28th about the same, had letter in heart — off to the country —

Complete pendancy and curling of the Epiglottis backwards in the form of a scroll, giving rise to certain symptoms –

Dr Cameron, D I G H, 39 Nottingham Place, 18 July 1863
came to me – Lone 30 years in India, and has been affected in the throat about 30 years. Recommended by Dr Peacock as I was close to him.

In 1839 he had slight haemoptysis, followed by great pain under & behind right clavicle; is some consolidation there he says, altho he looks so well, but he is of phthisical family. He had a powerful loud voice that could be heard by a 1000 men on parade – It cracked after 39 & pain came on in chest after talking. Has never any pain in the larynx, but a feeling as if a valve rose up in the throat, & a little expectoration of mucus gives relief. It returns if the voice is raised a little. Has suffered a little from relaxed throat & dyspepsia abroad but now is quite well. Reading at prayers in mornings, &c, produces a little hoarseness; damp weather brings on sore throat & relaxed uvula. Voice becomes decidedly husky sometimes. Has a little irritation low down in the neck –

Laryngoscopy showed a remarkable condition of the epiglottis

it was quite pendant horizontally and ~~to~~ both sides were curled backwards like a scroll, which however prevented its lying quite flat on the glottis, as in Figs 1 & 2.

1

2

By a deep sudden inspiration the larynx could be seen, with some congestion, slight of the cords, but much of the subglottis and upper trachea, where the mucous membrane indeed was quite pulpy & slightly tumefied, but not in the anterior part of the subglottis - These explained all the symptoms.

Over straining exertion of the voice, from passion, causing attacks of aphonia from loss of nervous power -

She is the youngest of 13 chil-

Mrs Davies, act ~~xxxx~~ 39, came to me July 20th 1863 with her sister; she is quite a young looking person but has had 14 children, 8 living; whilst her sister (Added 20) equally young looking has had 12. Seven -

She has had a cold in the chest twice a year, and the least cold affects her; lost her voice before she was married & she regained it after marriage, and it has recurred last 5 months. She now speaks quite naturally, but it hurts her in the right side of the neck. General health & appetite good in other respects. No dysphagia nor dyspnoea, but sometimes dreadful pain in the heart; is very excitable, & has a hard temper, very passionate; has to deal in old Clement who gives her much trouble - Sleeps well - very slight cough - Tightness in throat on waking in morning - Throat & larynx a large prominence beautiful, but forms a little swelled at sides - larynx has the cords separated & trachea a little so - voice inclined to be laryngeal sometimes - In fact her case is one of passionate over straining of the voice, causing temporary

Convulsion & subsequent loss of power -

Tickling sensation in the throat from pendant epiglottis

Leon Fresear act 18½ came to me July 23. 1883 for his chest and throat.

In good health all his life, excepting a constitutional cough since when young. His mother, still living, has had the same since she was 19, probably old tuberculosis. He has had a constant slimy tickling sensation in the throat for some time. He desires to cough but restrains himself, for its violence. Respr rough in both chest & feeble. Has a weak chest, sluggish temperament, dark complexion.

Laryngoscopy showed a relaxed pallid ulcer throat, with depression of the epiglottis backwards, per sketch. It had a thickened, stiff & swarm appearance. The larynx could not be seen. Can obj attempt beyond singing.

℞ Am Bromid 3ß.

Chronic sub glottic laryngitis, producing attacks of aphonia;

Miss Tidmarsh, act about 27, came to me July 23rd 1863 7 pm. Had a sore throat for 18 months, beginning in a cold, but principally it had been very much strained by excessive talking to a deaf person. There was complete aphonia for 6 weeks, relieved by blistering. 2 weeks after a second attack of aphonia for 5 weeks, also got rid of by blistering. Sometimes the aphonia is very bad & at others better, as well as the throat. She was very nervous when first ill about other matters; not so now - Before her illness she had a powerful strong voice. Had Scarlatina when 5 years old, & could not gargle, the throat was very bad & "nearly closed". Cannot go up a hill or stairs without the breath becoming short, no dysphagia - She took steel at Exeter with benefit for a time, but it caused epistaxis. Has been travelling, and her mouth & lips are dry & feverish, always so on those occasions -

She speaks in a delicate weak voice, as if Constrained, with a very little cough, no expectoration - Throat always painless, except recently when laying down

at night; speech at times as if nose or velum were at fault. Is very thin, and has had a great desire for fat since throat was sore - Very costive habit. No appetite lately has been so feverish - Has bilious attacks - Mouth terribly dry the last 2 weeks, not subject to colds & perfect soreness in the throat, unless in left supra hyoid artery, when the ligament inflames & forms a lump, tis now tender. General health usually not bad. She lives a few miles from Southampton, but was better while at Exeter - Sometimes has a heavy weight in the chest, pain in left side -

Laryngoscopy showed a pair of cords, of good colour, movable, in position of the slected - There was subglottic deep redness, and slight congestion of the upper larynx - Considering the symptoms there was not so much disease present as I would have imagined -

August 11th. She expressed herself as wonderfully better, for the Medicine agreed well with her, a circumstance that she says rarely happens, the throat greatly improved, voice as strong as ever, at Bromley. Her appetite is also better & she eats more, in fact she said my local application last time gave her a desire for food. She has been thin, although not weak. Her stomach usually has been irritable before this; all her sisters have diseased livers. Laryngoscopy showed a general improvement in the fauces, which were less granular & more pink. The sub-glottic redness was less, and the larynx was healthy & active. She had 2 take 2 pills to open the bowels, & they did so but once.

In the ℞ I made ℥ MSX & ℥ Card aa ℥ij ss.

20th Has been chilly for a few days, & throat feels husky, is feverish also - and her c. mag. ℞ Liq Am and ℥iv Mist pot di of this Mixture t. d. ℥ Camp Co ℥ij Syr ℥ij aq ℥viij.

Decem 11. 69 Dr Kiernan of Dublin do do do & vaccination.

Mr Wilder, act 30, was brought to me July 29th 1863 by the Revd Frederic E. Sykes, Sussex Lodge, Slough -

He was formerly a member of the Choir, but has for sometime (15 months) ceased to sing, on account of his throat. Singing produced strange stomach pains and hysteria, as Sykes says; but the pains were produced in the Chest & back as well as the stomach - He has pain now in the throat, extending into the back of the tongue, and on either side of the larynx running down the neck on gentle pressure - No dysphagia nor dyspnoea.

His throat has been this way for 15 months, and is attributed to his charge of a large Nursery of azalea plants, heated by high Temperature. He has been in this sometimes 2 or 3 days together, & liable to take cold after it; with heats & chills & anxiety - Always had a thick voice, but slightly hoarse for the 15 months - Used to sing a powerful bass - Has a slight cough & mucous expectn, but there is no positive evidence of lung disease, the breathing is not as clear as it might be in the left chest. His family are all healthy - Pains about the body like Rheumatism -

suffers from indigestion, feels queer in the head at times, and is of costive habit. He has been furnished recently by med bath in & externally Rx & Rx says -

He is a stout, rather healthy looking person -

Laryngoscopy my case. Delf, nimid & shiny red congestion of the trachea, subglottics & cords, but the last varies during their action, the redness becoming much less in approximation, the congestion then assuming a sort of fenestrated character thus

long lines running parallel to the cords, with their surface & them crossed by smaller ones.

The upper larynx was a little congested as well, but in other respects natural. Fauces healthy, uvula a little relaxed -

Applied Shoemaker bit arg with good effect with aid of mirror - & saw the mucous membrane & not so red quite white after, in larynx & trachea -

He feel this rather hot for a short time -

days, to inject the trachea.

August 3. I learnt from Hopkins, by letter that the bowels remained obstinately costive, so I ordered this ℞ — & not to alter mixt for a few days —

Hopkins says the throat is materially relieved & better & the purple suits him admirably.

12th Bath speaks & looks better, & feels his singing voice had comeback 2 or 3 times; but I admired him, secondarily, for Hopkins to give up his employment in the Hot house, which is regularly at 90° & this has retarded his recovery since I saw him. Mr Hopkins found him in a terrible bath, & the steam rising from the Watered plants, a regular vapour bath. Has difficulty in swallowing his spittle & not his food. Larynx shown the cords quite white, with the Crycoitic pore; epiglottis a little towards right- trachea nearly normal.

Acid shown to larynx & tannin to fauces.

Bath mixt & purple. Latter he finds to be first rate in sharpening his throat.

Felt a little warm after the shower.

September 15. Has been at the sea side, & his general health is much better, but his throat is troublesome from a cold. Bowels more regular, tongue very clean. Has pains in calves of his legs,

thyro-

shoulders & back; also in left hypoid articn. in back tis tender. Back of throat pulls sore & has bled - Voice better, though not strong; can sing but the throat gets dry & she has to cease Laryngoscopy showed the larynx normal in every way except being penetrated Congestion of both cords, which were otherwise beautifully white & pearly. Applied Shower Bat as my effectually & and tannin to the fauces. (to the painful part) and prescribed

14th Veins much less - but pain the same - He had taken the Iod Pot before he said - Tot Iod ad, both sides of larynx & fauces -

Continued at 196

Miss Edith Nelson aet 10 was brought to me July 30th 1883 by Miss Sutherland, of Laurel Villa, Lincoln, who was taking her back to her school. She is the daughter of the Rev Thomas S. Nelson of Lincoln. (see page 84.)

Has long suffered from deafness & her father was anxious to know whether the deafness & the throat had any connection & if the former depended upon the latter. He wrote that her whole nervous system is out of order, & that he had consulted Mr Harvey more than once about her deafness. His opinion is was that her nervous system is as yet imperfectly developed and that she will by growth recover from her physical infirmities, deafness included. Mr Harvey has always been averse to taking any active measures. Her deafness varies from time to time, during the last month however it has been much worse than heretofore and Mr Nelson did not find any satisfactory cause for the aggravation. In every other respect she has enjoyed her usual health. She has just returned from spending 10 days at the sea side. She seems to have no

power to sing at all, but goes about the house making a kind of drumming noise, which he thinks is her best effort to sing. From thickness in her utterance he is inclined to think that there is some connection between her throat & her deafness.

10 years old a 28th March last - Has 3 brothers, all healthy & quite well in every respect. Miss Sutherland told me she is peculiar in many ways; she does not sleep quiet as other children do, the eyes are not completely closed, one is more open than the other.

Has always been ailing a little about the throat & always a little deaf. Had pertussis. Her gait is unsteady, waddles from side to side. The merest cast in the eye; speech a little thick, & some watering of the mouth. Apparently a good natured child. She could hear on loud speaking

Laryngoscopy 3rd time, on explaining particularly what I wanted. The arch of the velum flattened & diminished, the passage upwards contracted, pillars partly adherent to the pharynx; some spasm of the velum & slight rigidity. Epiglottis normal, but very slightly pendent, cords normal as far as could be seen. Could not see the Eustachian tubes, but have no doubt

they are flattened laterally, & nearly closed by pressure
I am satisfied that the state of throat and the deafness are coincident, possibly resulting from scarlatinal angina. To relieve the spasm, & improve condition of the fauces & pharynx prescribed a gargle only

Ry Am Bromidi ℥j
Aluminis & ℞
Tinct Krameriae ℥j
Glycerinae ℥ß
Aquae ad ℥vj.
Gargle m & e -

I wrote to Mr Nelson, some of the above, & stated my opinion that there was some connection between the condition of the throat & the deafness, and that time would do much to improve both, say 3 or 4 years, and that it would prudent not to ~~give~~ take any active measures - I agree in Dr Haney's opinion of her nervous system not yet being perfectly developed. July 31st

Mr R Cole, Holybourn Lodge, Alton, Hants (formerly a surgn in Bernard St, Russell Sqre, Consd me 30 July 1863 at the recommendation of Mr Davey of the I of W light-
Is now a Magistrate & retired from practice -
must be 70 or perhaps more, with atheromatous expression well marked.

He complained of (an) secretion (mucus) of secretion from the mucous membrane, and liable to cold in the head, & sinuses as well. Genl health good in other respects; no dysphagia nor dyspnoea -
Laryngoscopy - Mouth could not be opened very wide. which I suppose explains why the epiglottis was not clearly seen; but 2 cuneiforms were seen on either side as represented in the sketch, and 2 little folds of mucus: were a false cords; yet there was no hoarseness nor other inconvenience. Larynx otherwise normal, but the impression remains that the epiglottis is not intact - Sometimes in eating food he finds it pass rather suddenly down -

He told me Mr Davy had
been his guest, & that he
would be happy to see me
if I was ever his way —

Capt Winnington, act about 70, came to me July 31. 1863
8 Petersham Terrace, South Kensington; builder in county
of Worcester, to consult about his larynx -
Recom by Mr Auldjo who he said had cured by blistering.
Has suffered off & on from a cold caught fishing
at Poole, since April last; he lost his voice 2 days
& then it returned; has no pain nor cough -
Little dryness occasionally arising the neck.
Irritation of do in bed sometimes. Suffers much
from a kind of suffocating feel (which he called
a kind of spasmodic cough) just as if he had swallow-
ed something the wrong way, & by taking water
or something he is relieved again - Is dyspeptic
& obliged to be careful - Is exceedingly nervous,
not able to take his usual exercise -
Laryngoscopy showed me the epiglottis almost
quite flat, & redness beneath it on the right side
where he felt the soreness - Parts a little relaxed.
I applied a solution of Tannin to under
surface of epiglottis, without causing, & also to the

℞ am Brom 3ß

Aquae ad 3vij ℥ß

fauces - with mustard &
I told him I thought - he
vomited soon he better, if
the epiglottis could be raised
again & The suffocative feeling has gone, & the chest is already more erect, and as the mouth & throat is dry at the root of the tongue, I made the Tr Ham 3ij -
(in the morning) He seemed much better -

James Benning Esq of Montreal, came to me 31 July 1863 -
I had previously seen him a 24th, & he had now returned from
Paris where he had been Recd, who ordered Visky water
for an eruption on the skin -
Has had irritation of the throat at base of neck for
10 years; he finds the stomach has something to do with
it. Coughing as an auctioneer produces this irri
tation - Subject to colds in the winter which extend
from the head downwards to the chest -
Laryngoscopy showed relaxation of mucous membrane of larynx
& cords, & some congestion (chronic) at bottom
of the trachea, well seen in his capacious larynx -

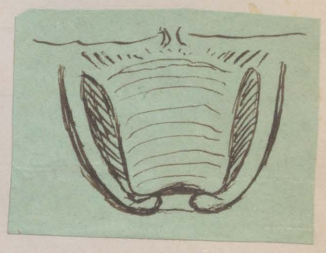
Pamphlet to be sent to Archibald Faulds Esq
within 2 weeks — 22 Renfield St, Glasgow

A Lappage, act 19, Messenger, came to me Aug 1st 1863
from D Wright, to request I'd be examined.
lives 3 Albion Place, Blackfriars. very pale & anaemic.
He had been in the Host for Consumption 11 weeks as an
in patient under D Cotton; they thought his vocal con-
dition arose from the stomach - on his paper for
Eastbourne from Wright was "Aphonia, Tuberculous
deposition left bronchial glands; congestive condition
of left lung."
Last his voice since a fortnight after Christmas for
2 months, it returned & has been off according to the
weather, fine it came, damp away. Now it has a
peculiar kind of hoarse loud laryngeal whisper -
No dysphagia nor dyspnoea, when before examined -
Laryngascopy showed depression of the
epiglottis almost flat on the glottis, yet by
great straining the larynx was seen. Carried
cushion swelling of the left false cord was seen
which prevented a view of the true vocal cord & left side
of the trachea, & rather encroaching upon the calibre of

the larynx, permitting inspection only of the right side of the trachea; 3 small superficial ulcers near the summit of the right vocal cord. Mucous membrane pale & anaemic & not at all congested —

Septem 11th Has been to Seaford, coast of Sussex, where he much improved & nearly regained his voice 2 weeks ago, he could speak easy & comfortably. But the cold winds have thrown him back. He has now a good colour, & flesh & strength. Appetite good, but odour & acidity of stomach —



Laryngoscopy - Swelling gone of left false cord, cords seem white, but mucous membrane generally much relaxed & slight tumefaction of both false cords giving rise to some hoarseness. Epiglottis transverse & elevated only by hemming or coughing.

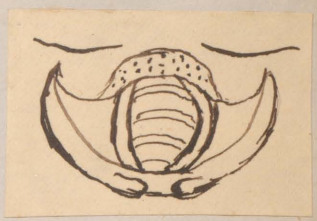
Miss Harriett Hopkins, act 49, single brought home 3 August 1863
from Brighton by Dr Broughton of Preston.
Has resided in Shropshire, father Rector of Fitz 6 miles
from Shrewsbury. Ceased menstruating 3 years ago;
generally health good as a rule. Actively engaged
bodily and mentally in relieving the wants of others.
Examined by Dr Brinton 12 months ago, & gargle & tonics
prescribed. Voice lost & and off nearly 2 years.
Just now is aphonic & always after talking or much
exercise is very much worse - No hoarseness, unless
occasionally - No dysphagia, dyspnoea nor cough -
Spirits good, cheerful & lively; can eat, sleep and
drink well. Takes a great deal of out door exercise.
Much wispering causes aching & pain at root of the neck.
Her usual whisper, is loud & soft, & distinctly audible.
Spoke for a few seconds day before yesterday -
Laryngoscopy. Had to use a very small mirror, because of the irisistance & spasm of the muscles of the soft palate & velum. The fauces
Had used galvanism for last 2 weeks without any effect, by a professed hand -

mucous, congested & follicular. So was the epiglottis, the follicles big bright red dots. The larynx was not much affected; the right cord was normal & so was the left, but the latter was very sluggish, as per skelet.



The trachea was much congested, very red up to the cords, & no doubt weakened the parts so that they caused not fairly close the glottis. The deep colour of the cheeks, & face, & the state of the throat, was the result of stomach. She had calm Bread pol & Brom pot for 2 or 3 months last past & Bromptons, latter in 5 & 8 gr doses without effect. Applied shower bath to larynx.

Apply to larynx

Cook semisse P. Pot Brom bis die ex aquae.

Regulated diet. No potatoes, pies &c. To continue ℥ss of sherry, aug 11. Very much better, the voice already becoming stronger. Little or no irritability or spasm of the throat remaining; the redness & congestion of the fauces gone, but the burning continued for some days, yet it did a great

deal of pain. The congestion of the trachea now a very palliative - Applied thereto a shower of Iodine Gal without any inconvenience -

Pt visit el gargle -

Oct 13 S B. says she has had an attack of inflm of fauces & tonsils any 10 days - The larynx much paler & the vocal cords almost natural - Exam of mel Bacaius & Dr Cates & Pt her visit - was soon better - He applied a little lint acy to the larynx instantly, with less pain than for the daub - Voice good for a few notes, but the damp weather has modified it. Send each inhalant - I told him to get the Pulvs of fluids of mine -

Referred to in Ed 2 -

Malignant Stricture of the Pharynx and Oesophagus examined when in a dying state -

Mrs Collings, aet 53, I saw on 10th August 1853 at No 74 Harmood St, Camden Town, wh Dr I. Kidd of 60 Mornington St. In good health all his life with a powerful voice - Latterly in last few months deficiency of swallowing came on, so that she cd only take a little liquid; & for some weeks past had been fed through the rectum. To day she was in articulo, but sensible. I made an examination of her laying down, holding out the tongue myself, & a lamp held by a person to her left. The right side of the epiglottis coming was elevated near its root, but the pain complained of in swallowing was at left side, & the stoppage at the root of the neck - The larynx seemed clear as far as could be observed - Nothing of course could be done - but it shewed that a person in the point of death, could be examd with the laryngoscope, without stopping or serious inconvenience - Yet it was an exertion for her to go through -

Quoted in Ed 2

Dysphagia for 6 years, from Stricture of the Oesophagus -

Mrs Burrett aet 41, came to me August 4th 1883 with her husband, with a note from Mr Ernest Hart: had sent to him by alderman Hale - She lived with the family of the latter for 15 years, until she married husband is pastor. Lis now at the Freemans orphan School - when her

Usual health has never been good - about 20 years ago was nearly choked with a piece of beef; throat bled much then & the piece of beef was pushed down. This was at the upper part of the throat - Has had dysphagia for the last 6 years - about 2 months ago was nearly choked and an instrument was endeavoured to be passed, but without effect, & next day the impacted piece passed. Dr Horn of Brighton tried to pass this instrument -

Usual times has been nearly choked, breath rather short occasionally, talking fatigues her - In swallowing solids is obliged to mash them first, such as meat - Fluids she can swallow without difficulty - Alderman Hale & family are anxious about her. Has become much thinner lately - Only 1 Child & was ad.

Laryngoscopy showed nothing. A large Bougie passed to the seat of obstruction but no further; it corresponds to the root of the neck. I resolved to tap and aspirate her.

Quoted in Ed 2

Variable phonation, in regard to tone and quality, depending upon a pendant epiglottis, cured by a single prescription.

Master Davies, 6 yrs old this Decem, on Aug 13th 1863 came to me with his Mama, recently Dr Greenhalgh under whom he had been for last 2 months, and 5 mos before that under Mr Wolff. Is a fine intelligent little fellow. Native of Dublin, but residing 2 years in London, in Brunton St.

Has been speaking badly for 12 months, but it began she says a long time since. The voice is at one moment a fine, sharp, low cavernal whisper, and the next a louder and more natural speech. which I heard him do myself. He can hallow quite loud too in playing. One of 6 children, all had pertussis, my slight 12 months ago, & none required medical aid, except the baby. No scarlatina nor measles. & has no cough. All the family speak well, is not hereditary.

Is very thin, and delicate, quite different to what he was, feels tired & languid, & is altogether cross & disagreable.

Has had a great deal of physic, cod liver oil,

steel, Iod pot, Mercury, Powder, Iron Brush &c -
Neck is sore & swelled now from the last - All with
no good result. Has been fed with all sorts of
good things as well. see sheet f 285.

Laryngoscopy was very easy, and I held out the tongue -
The epiglottis was pendant, flat, & immovable on the
glottis - Cords seen hardly, once only - Throat other
wise normal -

Perverted Sense of Smell, from fallicular disease of Throat & nostrils -

Capt Woolley, W.I. Packet Service, came home 19th aug 1863 about a smell of matter from the nose -

He has had an old cough for many months, and has since been very subject to colds about the head - The mucus from the left nostril has a smell of matter, more especially if he comes from the cold air into a warm room. Very fond of singing & used to have a fine voice, but has not now the clear voice he used to have. This has been so for some months. This smell followed some months ago from a cold, and curiously enough there is nothing unusual about it in his handkerchief. Can always detect it before he snuffs up. Has been much in the Tropics & very susceptible to cold. In returning home the last voyage he had an ulcerated sore throat (Sunelast) & a "fearful tongue". He got well of this, but has had nothing since the occurrence of his sore throat at Southampton, where he at present resides. Is a fine handsome looking man, with flowing beard & moustache, and about 36 years of age. He has been under treatment for psoriasis and incipient indi=

Jestion, and is subject to hyperacis, almost constantly for which he takes the Carbonate of Bismuth. His tongue is generally much furred, showing state of his tongue, & his bowels very costive. In fact his stomach has a great deal to do with his complaint. To day he is stuffed up but has caught no cold.

Laryngoscopy showed great relaxation of the mucous membrane of fauces, of a dark redness & unhealthy appearance. Pharynx studded & follicular, but no ulceration now. The larynx was normal, but were much relaxed, and so was it at the back of the nose, & rather congested in the left nostril. Applied Sol Tannin to fauces —

℞ Am Iodidi ℈j

He was much inconvenienced for a time from the Nit day -
11th Odour only once observed since; and feels only a little stop=
page in the nose. Rhinoscopy showed the redness of left
nostril gone, tongue very much cleaner from 1 pill only -
Exam[n] was very easy to day -
℞ Pulv asari Comp 3j
Pulv Rad Iridis 3v M
℞ Mist el Gayle
Tannin to the fauces only, } A small pinch to be snuffed
Uvula a little relaxed. } up the nostrils every night
for 5 or 6 nights -
21st Expresses himself as better & better - scarcely any or no odour -
Coughed a little cold at Windsor - Nose & larynx healthy, says his
voice is stronger - applied sol Tannin to fauces only -
℞ in Mist substituted
3r Cinch Co 3iv for the 3r Card - } The snuff he found most agreable.
℞ Gayle & snuff -
Oct 16. His sojourn at Harrogate agreed well with him, ate
& walked better - Sang more than usual & had a little hoarseness
after it - Has a slight touch of the smell once in a while
after walking, but it has nearly gone - Not snuffed since last
visit - Mucous Mem both nose & mouth quite healthy -
Little too much wine produces vomiting - tongue clean -
℞ Gayle & Mixture for 2 weeks -

First stage of Consumption, caught keeping by the state of the Larynx, the membrane resembling thick pile velvet.

Miss Walker, act about 26, came home Aug 20th 1863 with Mr Henry Stubbs of 14 St Anns Square, Manchester. He was not a Med man, but recom'd by somebody of Liverpool -

Her family are delicate in Chest, 2 brothers and 1 sister died of phthisis - She has spent the last 4 winters at Torquay & Clifton alternately, as a precautionary measure - Seen by Sir C J B Williams several times. Last winter at Torquay with relaxed sore throat & incessant cough, lost her voice occasionally; had double pleurisy there; Now she is relaxed in throat & continually coughing - Expectorates yellow phlegm - Does not thin, & always keeps up her flesh, but is depressed & languid - Irritation at root of the neck -

Laryngoscopy - Uvula & velum relaxed and follicular & slightly irritable - Larynx & thyroid congested & have mem smelled & like thick pile velvet & false vocal cords and laryngeal surface of epiglottis -

Applied Sal Nit & wh brandy -

Stethoscope no dulness at upper lungs, but breathing

hard & rough - both sides, w. pulsation beyond all over. no rales - Cough is bronchitic at present, altho no doubt tubercles are present -

21st Was much better during the day & less cough, but was a little worse at night, and this morning - The change in the Mucous Mem: of the Larynx in 24 hours was something surprising, for the deep scarlet redness had gone, replaced by a pale pink w. less tumefaction - I applied Sol Nit Arg as before, with a little spasm - & in Mixture changed Nucis Vom & Tinct Sanguin 3ij

There was some pleuritic pain over left back, corresp to lower end of shoulder blade - but the breathing was heard very distinctly everywhere -

Stopping at Westminster Palace Hotel - Referred to in Ed 2

Miss Frances Turner act 27, came to me August 25. 1863
just as I was about starting for Newcastle.
Recom^d by Mr Clowes of Windermere, who preferred me to Dr
Johnson. Has had Aphonia for 2 years from cold,
has only articulated twice, not spoken since last October.
Sound health good in other respects, & has a healthy
colour of cheeks, & looks to be in perfect health.
Beautiful rosea[illegible] complexion
Pain in Chest, no cough, no dysphagia. Resides at
Surrey, Leigh Place, Godstone near Red Hill, but just come from Lancashire.
Seen by Cormack a year ago last May, who said she had
irritation of false vocal cords; he recom^d electricity which
she tried for 6 months. Swabbed innumerable times.
Has taken almost anything - Does not sing nor has ever
exercised the voice - Is worse in damp weather -
no headaches - Had coughs every winter until the
Aphonia came but not since. The pain in the chest is
severe, has been exam^d by Barrows & Williams. Former
said there was a little irritation there. Has a little expec-
toration in the mornings. The Aphonia is most com-
plete, but she can utter an audible whisper -
(Her bankers are Barnett, Hoare, Barnett & Co, Lombard St)

Laryngoscopy showed nothing abnormal with true & false cords - but some sub glottic congestion extending into the trachea - And impossibility of closing the glottis in coughs

thus. Am bod ℥j

Case of Chronic Oozema in a young lady - examined at Nottingham with the Rhinoscope for Dr Massey.

Young lady aet 21, I examined on 26 Aug 1863 at Nottingham for Dr Massey. Is a fine healthy girl, with a discharge from the nose, of both sides for some 10 years - very offensive & yellow & green - as if bones were diseased. Health otherwise good - She had tried anything in vain, & she cannot go into Society in consequence. Rhinoscopy was not easy, but it was done nevertheless. Dark crimson redness of turbinated bones with some swelling, but no ulceration visible, altho it is probably found in the labyrinth -
Uses sometimes Lemon & keeps a day -
I prescribed an Bromine &c - & advised the injection of Sulph Zinc or Nit Arg alkaline powders & acid in front -
& applied a brush there myself with some intricate -
Dec 8 No great change - advised Bromine in 3 & 6 grs, & Cinch Co 3ij x x 6 3ij
Syr Iodatis 3ij 5j - t. d -
For nose Injection of Condys fluid & also of Nit of Uran 3i to the 3i -

Aphonia & phthisis in a young man. Ulcn of L Card
right vocal

Aug 26th 1863 - I examined a young man, at Nottingham with phthisis & aphonia, a patient of Dr Wm Tindall Robertson. The epiglottis was partly pendent, but I had a good view & made out the aphonia to be due to ulcn of the right vocal card, & showed it to Dr R. He had a good reflecting mirror at back of an argand lamp of curious construction - Prognosis bad - Dr R has notes of it -

Aphonia for 2 years, from paralysis of the muscles -

On the 1st Septem 1863, I examd a female patient of Dr Heaths, at his house in Newcastle, act about 35 - with aphonia for 2 years - Everything appeared to be normal, with the Laryngoscope, beyond some thickening of both cards, which gave them a wounded appearance, but on attempting utterance the cards did not approximate near them is shown in the sketch - I advised the direct use of electro galvanism -

Mrs Pyke aged 32 (single) came to me Sept 5th 1863
recom^d by Mr Brown's postman — no family —
Has had enlargement of the glands of the neck off & on for
3 or 4 years — It is a distention — They come & go;
the right submaxy^y is as large as a pullets egg
flattened; they run down left side of neck to the root
behind the clavicle — No dysphagia, nor pain, nor
dyspnoea. Health quite good in other respects —
Tartar & Mentha not lining — Vibration alone — but
more times affected — Has used lotions & cold lotions
externally, & taken Ol Mark & Lucin internally —

℞ Am Iodidi gr xxx c. mag —

bis die.

Mrs Terry æt 27 - Mother of 5 & 6 chil - Sept 5. 1863
was brought me by Dr Murray. Thin, spare, young
woman -

Five years ago she swallowed a fish bone, went to King's
Col Hosp & was treated there. Lately examined w the laryn=
goscope & was told something was curving out her epi=
glottis - Has been troubled with Hyd & breath is
now offensive. Has Pain at back of neck from the
shoulders upwards, at the root of the neck in front,
& in fact the entire throat is painful, and this
causes her to feel very miserable. Has dyspnœa & dys
phagia, food always sticks & lodges in the throat -
She feels something in the throat like a peasy ball, and
brings up occasionally "pieces of flesh like corruption."
She swallows anything, fluids or solids with difficulty,
sometimes & milk will lodge - No regurgitation thro
the nostrils - Great pain in nose & eyes, like sand
in latter - Dr Murray says there is much hysteria,
& I agree with him -

Laryngoscopy showed nothing abnormal, & the viscera was

Peculiar sensations in the throat and larynx, mainly depending upon irregular pendency of the epiglottis.

Colonel Walker, R. C. Rifles, came to me September 9th 1863, recommended by the Asst Surg of his Regt St Killery in Canada - everything had been tried and without benefit. now staying at 26 Victoria Road, Pimlico - aet about 55.

Attacked with Bronchitis 3 years ago, following by a peculiar sensation in the throat of a lump there; it has been getting worse all that time. In bad weather this feeling runs down to the middle of the chest - No dysphagia or dyspnoea - By breathing thro the mouth nothing is observed, but if thro the nose, a sensation is produced of cold, like when Cologne is placed in the hand - It troubles him a little in sleeping at night, especially if laying on his back - On a cold day, or even without he frequently hems, & endeavours to get up some thing from the throat - Has resided in Canada last 10 or 12 or 14 years - Voice sometimes lost if used a 3 or 4 hours, but it has not been strong lately on giving the word of Command. Is married with a family & rather anxious, was afraid of Cancer -

Laryngoscopy. Epiglottis slightly pendant & irregular as shown in the sketch, but could be elevated by forcible hems

showing much congestion, relaxation, and general redness, with some slight tume faction of the mucous mem: of larynx, vocal cords & trachea. No ulceration. The fauces also were slightly relaxed. Applied Sol Tannin to larynx & fauces. Prognosis good.

Follicular disease of the throat & larynx, with some tendency of the epiglottis.

Rev^d Mr Haymand, act 32, brought to me Septem 15. 1863 by his brother in law Mr Barker of Wantage, Berks, recommended to me by (Walter R. H.) Mr Weeden Cooke -

Had been affected with sore throat since Easter last, until he caught a cold a week before that his voice had always been good. This was followed by exceeding hoarseness and no power to continue speaking, and has done no duty since then. He can speak ordinarily but cannot raise the voice. Sometimes has pain extending from ear to ear, & he always feels stuffy & full. He caught cold lately in Scotland and was worse still for a while. Genl health good in other respects, no cough. occasional hem to clear the voice - No dysphagia nor dyspnoea. Mr Barker snipped off uvula 11 years ago, for a tendency to cold & bad cough. He is healthy looking -

Laryngoscopy not easy, & well seen by Mr Barker - Extreme congestion, relaxation & some turnefaction of mucous membrane of larynx & that coming the cords - No white appearance to be seen - Epiglottis disposed to be pendant - Follicles enlarged here & there - Fauces in same condition but not so bad as

the Larynx - I saw a written opinion for the Bishop of Oxford that he would be cured in from 3 to 4 weeks - as an opponent must on the banks of the Thames depended upon his cure -

Applied Sol Tannin to Larynx & the fauces -

℞ Ammon Iodid ℈j

Mr Barker is very much like Mr John Adkins -

Sept 22. Fauces a little better - Shower but dry - & Sol Iod dry to some deep ulcers in the pharynx -
added Tinct Kramer ℈ij to Gargle - PL -

24th - Improvement very decided - ulcers of pharynx smaller, fewer. Mem of Larynx less swollen, more pink, & edges of cords becoming white - Sol dry to Larynx with a brush, & also to the fauces - His health is better, but a little of the cold remains.

26th Sol Iod dry to Larynx & fauces, but 2 ulcers seen in the cheek, where he used to feel the aching -
Cords better seen - Pt omnia -

29th Shower 3n Gulf & Sol Iod dry to fauces -
Is steadily improving -

Oct 2 Some little tumefaction of mem above the right vocal cord - Best view of the cords I have had as yet - Applied

In Milk made am Iod 3/5
W Cinch Co Brij -

Sol Iod Arg to Laryn & fauces 1/2 purple -

Oct 5th Found clear view of the Larynx, epiglottis rising more - cords clear, but trachea still covered - Shower Zn Lact and Sol Iod Arg to fauces - better also better, voice less - Evening singing Voice not Saturday well -

7th Improved still more manifest, & the epiglottis is still more erect - Applied Sol Iod Arg to Laryn only - & added 8 gr Sulph Zinc to Gargle for the

Faucial denudation -

10th Found view shaved bad, both cords are (very) white, & act well; epiglottis quite erect, its cushion is very salient - Applied Sol Iod Arg to Laryn & fauces - Sc chanted Mass, at Westminster abbey yesterday for 15 m, & felt a little hoarse after it.

19th On Sunday 11th read 1 lesson in Morning & 1 in afternoon without any inconvenience, unless a very little brief hoarseness after each -

On 17th at the Piano he could get up to 2 notes higher than on a previous trial - On 18th read 2 lessons in Morning, & long exhortation in Communion service & 2 lessons in the afternoon; now & then sang a little in Chanting; no inconvenience at all from it - & to day the throat seems stronger and clearer -

Laryngeal parts quite natural, cords beautiful & very good in sounds applied Shower of Zinc - Sol Arg to fauces - Pt hint of Laryngeal

29th a 25m and 7 lessons & litany & 1 lesson & baptized 3 chil. m eo.

316 Chronic Inflammation of left thyro-hyoid articulation and ligament -

Mr Raemaekers aged 31 - sent to me Septem 17. 1863 by S Wright of Somerset St - Has had soreness in left thyro hyoid articulation for 4 months - Not affected when first after eating sometimes, & even without - A sort of Knowing sensation - Genl health good in other respects, no sore throat - Lungs feels sore in deglutition -

On Exam I found Chronic inflammation with some enlargement of the left thyro hyoid artic, which was tender -

In a note to Wright, I suggested use of very small doses of Iod pot internally, & Ung of Ext Belladd & Oxide Zinc externally every night -

The Laryngoscope showed nothing - He had used an Iron, dry hot, Tannin, Pencil of Iron, &c -

Impaired vocal power, and extensive ulceration of the fauces and epiglottis after an attack of Diphtheria 5 years before —

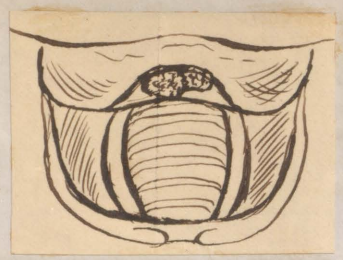
Miss Tweed, act about 34, came home Sept 17th 1863 with her brother James Tweed Esq, from Lake Baddow near Danbury, near Chelmsford —

16 years ago had an attack of Quinsey, very bad, ill 5 weeks or more. Had Diphtheria in Decem 1858 & nearly lost her life — Throat ulcer ever since — every change of weather affects the throat & produces small ulcers —

Family rather subject to sore throats, Mr T and his father. Former had a bad throat often & ulceration when young & for years he had glandular swellings —

Miss T's voice goes sometimes quite away, & she has no power to speak, especially in the mornings on rising, mouth is then dry & heated. Ulcer of the throat frequently comes on. Heating herself in walking gives her sore throat; Damp weather does so dreadfully. Dry fine weather suits her well, & she is fond of quiet — Speaking is an exertion & formerly she was a loud & beautiful reader: an hour at a time when weather whose sight is bad — She requires high rooms & plenty of

fresh air - Last season last year at phthisis - Has many relatives Medical men - Cousin in Bath St -
Genl health perfectly good in every other respect -
Feels quite exhausted when this state of throat is present -
Dr Duncan said it was a case of incurred Diphtheria -
Had had almost everything - Is feverish faint
when the throat is affected -
She feels as if a line was drawn across the neck, and a
band of dead pain at the root of the neck. Cheeks flushed
& feverish - Very nervous - Has almost constantly to hem,
at Church or reading &c, & has to make an effort to
swallow - At night itching & dryness of the throat which
is worse than the ulcers to her - Has dysphonia -
Inspection showed distinct ulcers in the pharynx & on the
left tonsil, with red margins, the mucous mem: was
in a chronic congested state, & follicles seen here & there
enlarged -
Laryngoscopy - showed chronic redness of larynx, partial
paralysis of the vocal cords, widely separated and with
very feeble action, and a large ulcer at the upper part
of the laryngeal surface of the epiglottis, which fortunately
was not pendant - This ulcer had red margins and looked
very irritable, see sketch - Trachea seen far down &



not much affected. Pharynx and a thin slice of Lobule of Epiglottis with the nitrate scares of times -

June 15 Has been lately worn out with constant pain & suffering in speaking & eating, she says it has been torture, what with pain at left side of neck, head & ear - Head not clear gets confused - Much thinner, tongue swollen & sore. Has excavated ulcer on left pillar & here & there at the root of the tongue - Larynx & voice healthy - No cough -

Continued at page 38.

Sore throat for 5 years, with a constant irritating bronchitic cough, producing general redness and tumefaction of the entire larynx.

N. W.

Mr George, surgn, 1 Buston Pl, Camden Town Sept 21st 1863

came to me recom'd by Henry Smith of Caroline St -

Aged 56 - 5 years ago he broke a blood vessel (no doubt in the throat) and he has had sore throat ever since. It comes on with a violent tickling & irritation of the throat, & constant cough - He expectorates a little now. Coughs, chains & retches horrendously in waking at 3 am after his 1st sleep at night - sleeps well a 1st going to bed - has no more sleep the rest of the night -

Health and appetite fair the cough, bronc: mem: pers relaxed, throat & eyes red - Urine he says wrong - Marshall of 11 Cliff Street treated 2 yrs ago, for the irritable cough -

Laryngoscopy showed redness & tumefaction of the cords, & other parts of the larynx, chiefly from the cough, which is bronchitic - I applied sol Zinc to larynx -

℞ Aq Amygd Zij

1869 Miss Aylward from page 34

Aug 28 She turned up quite well in health but still aphonic, & I found the larynx quite normal, but the Inter. Mem in subglottic relaxed & flabby - I used spray of Zn wh Clarke -

℞ Zinci & Alum aa gr x ij ad Aquæ ℥ iij

To be used as spray t.d.

Ch Aqua ℥ iij ℞ wh Clarke for 2 mins -

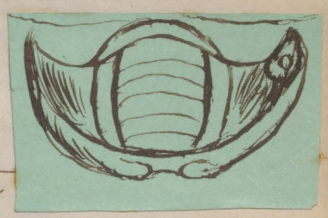
30th Whisper very much louder - applied a dsf of Sol Nit arg to Vocal Cords with my laryngeal Injector - Go on wt Spray & use an Alum gargle -

Sept 1 Repeated Sol Nit arg to larynx with Injector, & carefully regulated her diet, so far as beer was concerned & suppers - Goes into Slough for a few days - Pt Spray &c -

A feeling as if something was in the throat, with an cough irritating, associated with some irregular pendancy of the Epiglottis -

Lt Colonel Henshaw Russell, act 51, came to me Sept 22nd 1863
Commands a Dept at Plymouth, and his voice is so powerful & strong that when giving the word of command in the mole below, it has been heard on the heights above -
His mother had a powerful voice up to the hour of her death - (Staff Offices, 7 Osborne Villas.
Has had a Cough for sometime and a feeling as if some=thing was in the throat. He first felt as if a hair of a tooth brush was in the throat. This made him Cough, & matter, blood, &c were expectorated, and he got better. But the cough always annoys him very much.
The "glands about the neck" have been swollen, and a feeling as if a finger was in the throat -
Last Sunday, 20th, he coughed up something, like a piece of stone - ☐ of this size and shape. Two years ago he had a crumbling tooth, & it might be a piece of it. On subsequent exam^n I found it really was a piece of tooth. Both his cough & expectoration have been certainly better since it has been expelled.
His general health has been bad in other respects. One night

a quantity of blood came up, & he was supposed to be phthisical, there were 12 doctors attending him at the time.
Voice has never been affected by his disease, he has much speaking to do out of doors - Has a fine sonorous voice.
He still has the choking feeling in the throat -
Laryngoscopy - showed some tendency of the epiglottis with twisting towards the right side. On lemming or slight coughing, it was elevated, and permitted a good view of the larynx, with a perfect pair of vocal cords. The trachea was normal. at the left side, corresponding to the flexure of the epiglottis backward was a little red swelling with a depression in the centre which must have given exit to the fragment of tooth, no doubt lodged in the fold there in the beginning.



The state & position of the epiglottis and the swelling, explained many of the symptoms suffered, & had much to do with the cough. I applied a sol of Lact Zn with cotton bent to the larynx, & ordered

J. M & R.

He told me he had been examd by the Surgeon of his Regt with the Laryngoscope, & terribly frightened by introducing it hot. He had not used it on any patient before the Colonel -

The Colonel was recommended to me by Dr Astley of Dover ~~Hastings~~ -

The pain in the neck was due to general periostitis (chronic) of the entire body of the os hyoides, which felt enlarged and was tender -

25th Is better on the whole, swelling in neck somewhat less, cough less, very little to day; and old thoracic pains are gone, together with one the last 2 days he used to have in the left belly -

Bleeds from the nose, & has done so occasionally since youth, when he has a cold - His Children also bleed from the nose -

Mucus he coughs up, has all along been very tenacious, and at one time was streaked with blood - When in the tropics he never perspired from any place but the forehead & backs of hands -

Larynx shewed a great improvement in the state of the epiglottis & mucous mem. The little swelling was gone & a mere slit left - Applied a sol 3ss salt nit to a brush to larynx, & 2nd day to some ulcers in upper pharynx behind the velum -

1866

Jany 23. In Times of this day, I read of his death, suddenly, at his residence Osborne Villas, Stoke, Devonport -

Lieut Col Henshaw Russell late Staff officer of Pensions, Plymouth, formerly of 97th Reg, and 64.

Quoted in East 2

Follicular disease of the external meat & larynx for many years, with hoarseness pun swelling of the left false cord; congestion of the brain -

Mr Bull, act 55, was brought to me Sept 23rd 1863 by Mr Arthur Firth -

He had has hoarseness since 14th last, but has been subject to it for many years, although not for a long while - General health not good in other respects - Has great uneasiness in the throat in front, and at the root of the neck - Has used salt & acid gargles, sinapisms, sucked ice, &c. Gets worse towards night, when the throat gets dry, and it wakens him & brings on palpitation of the heart. He has been subject to a nervous affection as well. Sometimes he has, but at other times has not a difficulty of swallowing. Has felt as if there was an ulcer at the root of the neck, where it is tender. Bronchial tubes sometimes very bad; whenever he gets a cold, N. or N E wind, it flies to the throat. Some years ago had an ulcerated throat, but not now. At night this sensation in the throat brings on a hacking cough, and so on it goes even although taking a little drink - a little biscuit pot: has done him good last 2 nights - Can speak only in a whisper or rising in the mornings until his mouth is moistened -

Mr Tenth said Mr Ball had slight convulsion of the brain a short time ago & this produced a great amount of nervousness in consequence whenever the throat gets bad - Stomach is exceedingly sensative, and medicine requires to be cautiously given -

Inspection showed remains of old ulcers in pharynx, & tonsils, congest^{n}, & general relax^{n} of the mucous mem. with enlargement of the follicles -

Laryngoscope revealed the same condition affecting the mucous mem. of the larynx & trachea, only worse than in the fauces - The colour was bright-red, & the swelling of the left false cord so considerable as to obscure a view of the true cord: this gave rise to the hoarseness. Applied a shower bit acq most effectually with the aid of the Mirror - This caused some burning, but gave immense relief, for it in a few moments took away the hoarseness and restored a full & strong toned voice -

I applied a sol Tannin to the fauces -

aged 62

The Revd Edwd R. Nares of Wittersham, Kent, Sept 25. 1863

came to me at the recom of some 6 or 7 different persons - He had been spending the last few days at Addington Park, with the Archbishop of Canterbury - The air there was very bracing & he felt better for the change - where he lives, between Tenterden and Rye, (high & healthy, but not bracing) on elevated ground, the climate is relaxing like Hastings - Not far from Romney Marsh - Born 1804 or 5, and aet 58. Has had loss of Voice and hoarseness since last Easter 12 months, the latter constant. Forcible exertion in his Church to drown the noise of coughing brought it on, never suffered a days illness before. 12 months ago was under Mr Bishop who applied Sol Nitrate, examd his chest, & found no disease of lungs - Tried Faradisation under Dr Althaus, but did not give it a chance, as he wanted him to undergo it twice a week - Coughs more than formerly, & feels a little more pain in throat than used to, & perhaps is more subject to cold - Voice is feeble and almost lost in the mornings, he had a most powerful voice at one time, was equal to 3 octaves, worked it hard as a Clergy-

In habit of drinking a bottle of sherry daily -
Mr Levy known him for 40 yrs. & attended him 17 -

man - how it is hoarse & rough, but low, yet not inaudible - But it sounds as if there was obstruction -
Has very relaxed uvula occasionally, and when touched with Tinct of Capsicum it rises immediately.
Subject to a gouty condition and drinks 3/4 of a bottle of sherry. At 17 had an attack of Gout and was cured by Brodie. Latterly taken a rheumatic type, & has had much colchicum. Must keep himself up with wine, &c -
Not a martyr to Gout, but is more precipitate. He has the atheromatous expression too well marked.
Laryngoscopy showed a pretty irritable throat, with depression of the epiglottis, gouty?, and much chronic tumefaction & redness. Interior of larynx was seen a couple &c, & true & false cords & trachea all red and inflamed, but no growth could be seen - Fauces also relaxed, but the disease was not the true follicular -
Applied Sol Nit Arg to larynx, & Tannin to fauces -

33 Phthisis Laryngea et Pulmonalis, with oedema of false vocal cords, & ulceration -

Wm Smith aet 34, came to me Sept 25th 1883 with a letter from Mr Francis M Corner, 3 David Place, Poplar. He works at saw mills & exposes to changes of temperature -

Mr Corner wrote that he had tubercular deposit in the front of left lung, which has been quiescent for many months, the throat symptoms commencing with Aphonia 2 without any discomfort further until a few weeks ago when much pain & dysphagia ensued, he now being unable to get down anything but liquids - unless some relief is afforded he expected soon to find the lung breaking down.

On seeing him, I learnt he had Aphonia on & off 2 years, but continuously lately for last 6 weeks, when the voice has been a low whisper - Coughs in swallowing - Throat feels very sore, & deglutn causes great pain in right side of the neck, at the Thyro-hyoid artic[n] - due to inflammation there - Can't sleep at night - Always healthy & strong & stout up to 2 years ago - Is very feeble & weak, lost flesh lately, & can scarcely crawl - Has taken cod liver oil & other remedies - Embrocations - Inhalations - Ointment &c

Voice had last 6 weeks - Respiration bad -
Laryngoscopy showed swelling & oedema of the epiglottis, both cushions projected, & slightly pendant, as well as of the false cords gradually extending to the true cords, which could be seen white - beyond the glottis I could not see - Deep ulceration was found in the swelling on the right side, not seen in any view -

He was admitted into the Westminster Hospital under my care, & I prescribed

Wine 4oz, Beef tea Oj, Milk Oj &c -

29th He was already much easier & the pain in the neck less, but expectorated a good deal of frothy mucus. The mixture he found strong, so the Tr Camph was made ℥ß - & other things to be continued -

Oct 6th Still improving, can swallow better -

Next day dyspnoea set in, which was the result of extension of the pulmonic disease, the expectoration was a thin watery yellowish fluid, not rusty. Much crepitus was heard at the

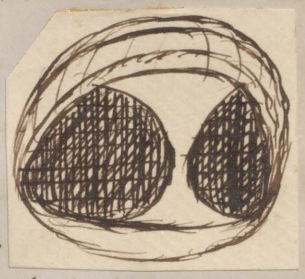
apices of both lungs; and especially in the upper lobe of the left; dulness was marked at the base of this lung in front, and over the greater part of it behind. The voice was now reduced to the merest whisper, and as the disease progressed he could swallow only small quantities of fluid at a time, about one half regurgitating partly through the mouth & thro' the nostrils. On the 8th he was excessively low & passed a restless night. On the 9th he was weaker his pulse 128 small & wiry, & breathing very difficult. He was propped up in bed, & several times expectorated small drachms of thin yellow purulent fluid. He died rather suddenly at 2 pm, got quite exhausted.

10th P. M. Ex. 24 hours after death. Body much emaciated; rigor mortis very strong, mouth firmly closed.

Right lung highly emphysematous anteriorly; posteriorly generally infiltrated with miliary tubercles, in the acute stage. At the apex were 2 or 3 very small cavities, & softening of tubercle. Pleura adherent above. Left lung generally diseased, & almost solid in lower lobe & post^r part of all 3 lobes, from deposit of acute miliary tubercle. In upper lobe were several cavities, one size of a small orange, another of an egg, with vessels crossing them in different directions. They contained some yellow watery fluid similar to that expectorated. Pleura almost entirely adherent, & long tissue broken up above in getting the lung out. Pericardium contained about

Bowmen of clear yellow serum, and the cavities of the hunterian filled with red & white coagula, running into the larger vessels. No evidence of atheromatous disease - Rest of viscera all normal except the larynx -

The trachea was much enlarged especially below, and the right bronchus was much larger than the left and started off at a sharper angle. Its laryngoscopic appearance is here represented - The view of the vocal cords from below is also here given, to explain the supra glottic nature of the disease.



Oedema of all the parts above the glottis, namely the epiglottis, the aryteno epiglottic folds of M. M., & that covering the false cords as far as the ventricles of the larynx. That covering both cords was so to a slight extent, but the ventricles were not obliterated. The posterior part of the aryteno epiglottic folds, containing especially the arytenoid cartilages formed 2 cushions, thus rendering the action of all the parts either nil, or extremely limited. An oedematous tubercle the size of a pea was found to the left of the epiglottis. This cartilage was quite erect, & rose 1/4 of an inch thick. Its laryngeal surface was ulcerated in several places, especially at the base of its free portion, and in some had the patient lived, it might have been destroyed. The mucous membrane below this to the right side was also much ulcerated, at the spot seen during life.

The M. M. or the true cords was also covered with small, minute ulcers. Under the microscope the matter from them contained a number of granules minute resembling those in true tubercle -

Quoted in Ed 2

The Revd T. H. Britton, of Truro - on 29th Sept 1863
came to me with Mr R. Dunn of Norfolk St, Strand -

Has had a sore throat for 20 years, the last 7 or
8 particularly annoyed by it, especially with occa=
sional loss of voice, often occurring suddenly, but
he has it always more or less -

Sound health good abstinence; is a stout man, &
says pain from gout, as his father did before him -
11 weeks ill with gout in Lenny Cast, but was free from
it for 11 years. His father had stone, operated twice by
Lawrence, & after passed hundreds by the urethra, probably
500 he said -

He feels a great pressure in front of the chest, & right side
of the neck - He feels languid & wants energy sometimes
arising in the morning - Lately had enlargement of one
of his testicles -

He finds it very difficult to read the prayers, some of the
words he cannot utter altho he continues on; this is not
so in preaching - He has to perform 3 services every Sunday -
(because the voice is in a different tone) In reading the epistle

some of the words are not audible -
All this is attributed & cold in the first instance, and night reading &c, becomg warm & then expand & cold -
Laryngoscopy showed some depression of the epiglottis, and active congestion of the larynx, vocal cords & trachea for down. The white colour of the cords was quite absent - Fauces not specially relaxed, but the pain in the neck, was in the right thyro-hyoid joint, probably gouty - His Mc Quinn saw -
I wanted to use a shower bit arg, but as he had to attend a meeting I used the brush to the larynx -
& Sol Tannin to fauces

7th Nose much better, but was very ill 2 or 3 days after last visit. Pulse looked more natural — c. mag. t. d —

℞ Ammon — Inhal with Weiss Inhaler of Sol Sulph ℥ss ad ℥j

24th On the whole improved, but is little hoarseness in morning from dryness & relaxation of larynx, but it is not inflamed — nose quite well. Takes the Bromide of Pot with advantage — applied Throw Nit acy to larynx, & brush to left side of throat, & uvula; the last was much inflamed — would take no med —

April 1. Had been bad again, but was better, though hoarse in morning — Throw Nit acy to relaxed larynx — Had stopped his daily ♁j Champagne — Throw done with advantage —

May 9. Has been quite well from end of April to noon — but from a cold has general redness of fauces & larynx, especially swelling of right false cord, & red trochea. Throw Nit acy to larynx — Inhal Spray with Weiss of ℥ss & prescribed it with Clarke's of 6 gr Sal — Voice husky —

1870

Jan'y 20. In Times of today among the deaths, was:—
"On the 19th Jan, at Richmond, Benjamin Bull, in his 62nd year.
Friends will please accept this intimation."

344 Tallowlar disease, chiefly confined to the Larynx, with a partly pendant epiglottis, and ulceration around it, good recovery -

Greenwich, Kent

The Rev W^m Lane, æt 70, brought to me Sept 30th 1863 by Dr Murray of Green St -

His voice became affected about a month ago, this was followed by cough & was very serious, for there was so much phlegm, the nostrils also were constantly full of it, like a catarrhal cold -

He had seen a white looking ulcer at the back of one tonsil, which was cut off by Mr Cock of Guys 2 weeks ago - It till more than a month altogether - Dr Hastings passed a sponge down his gullet -

He has now an unpleasant feeling in his throat, with deafness & no taste nor smell, & perhaps all may have originated in the throat - Cough has not gone, & felt quite breathless a walking from the station - Not usually subject to cough, & it does not prevent him from sleeping. It has not hindered his duty, but the voice has fallen - His usual Voice is good & sonorous

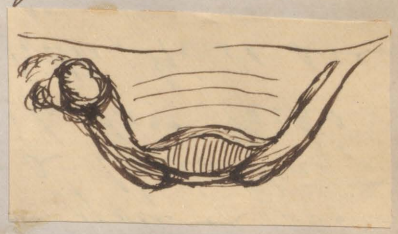
Is a fine hearty looking man, with snow white hair -

Laryngoscopy showed depression & congestion of the epiglottis, especially its upper border, & also right margin in the

xx they nurses large & prominent as charms & totally disappeared suddenly before he came home.

2-1

fold epiglottic, was a body like a small kernel, seen repeatedly by Dr Murray, & may be the remains of an abscess or a distinct growth - It appears that Mr Cock punctured an abscess there & let out a teaspoonful of pus - He had no tonsils at all - xx No operation at present could be thought of, although it had been previously mentioned by Dr Murray. The larynx was much congested, but the cough was mainly caused by the position of the epiglottis over an irritated larynx -



Supplied at 1st Visit Acy to larynx & Ladacy to pharynx. The latter were much steadied & pellicular, probably of some years duration -

1864
Nov 10. Looked in upon me perfectly well, never ill since last Sat when I stopping my cards
he saw me - cured in my recent - 16th by request -

1866
January Archdeacon Davys wrote me, that Mr Lane commissioned him to tell me that he had not any throat at all, this Xmas

Amy Ellis, aged 19, came to me Sept 29th 1883 from Dr Logan, by request of him at West London Hospital -
Had sore throat 12 months, came with a lump at the root of the neck, & has continued to this time. Very bad at night, has dysphagia & the lump comes on the tongue when she speaks much. Cannot sleep well at night because the lump comes up really & chokes her - Health good in other respects - Is pale & anaemic - Catamenia regular - Sometimes gets very nervous & fretful about herself - Has been 6 weeks under Logan - Suffers much from pain at the middle of the chest in front - Brothers & Sisters quite well, no cough - It followed upon a cold, & next day there was a lump in the neck as big as an egg -
Now there is only a trace of a lump to the right of the upper end of the sternum, but nothing abnormal is to be seen with the laryngoscope beyond a little depression of the epiglottis -
Voice is good & swing-pain only when she feels the lump in the neck, & then it goes away -

Feb 22 No swelling in neck except in Wings of Aspect & pieces of cartilage came away, & portions of the ring projected. Fauces are a little relaxed now as well as M. M of Larynx. Is a cicatrix in place of ye tumour
March 7th a distinct depression can be felt in the front wall of the Trachea, as if Tracheotomy had been performed. Health good, but feels a soreness when she breathes sometimes.

350 Hoarseness and Aphonia from chronic laryngitis for 38 years, after small pox. Severe dyspnoea from swelling of the false vocal cords, requiring tracheotomy -

Mrs Ives, a lady aged 60, on Sunday 4 October 1863, I went to see at Tottenham. I reached the house of Mr W. Hall, her Med Adviser at 4 pm, and he drove me to her abode -

Has had aphonia, hoarseness, and laryngeal attacks on and off for 40 years, or at any rate 38, for at 22 she had small pox, and was unfortunately inoculated with the disease which she had it, and the malady was not only very severe but much prolonged (so she told me) and her throat was materially affected, (she had the disease double she said, 14 & 21 days) and much ulcerated for sometime. On one occasion Mr Hall informed me she had aphonia for 2 years, & the voice then returned. Has been hoarse and aphonic now for 4 months constantly, although the former was frequent before that -

I found her sitting in a chair, breathing with some difficulty and with an inspiratory stridulous noise as if there was obstruction. She could speak in a loud and audible whisper, but with some pain, or perhaps

more effort than pain. ~~Had~~ Felt a weight at upper part of the chest, and def. sebilat. pain in the right wing of the Thyroid, & left thyro-hyoid artic^n, latter not so severe as the former. She felt a line of distress across the Thyroid Cartilage. Atheromatous expansion well marked in ears, eyes, face, &c. Much troubled with bile & flatulence. Has attacks of retching which ends in violent coughing and expectoration of bloody mucus, which no doubt comes from the throat, for I was told there was no lung disease which I fully believed.

Laryngoscopy well borne 3 times, and view of disease satisfactory. Had a small calyx oil lamp.

The false cords were so swollen and oedematous that the upper passage was almost closed, and no possibility of seeing the true cords or interior of the larynx excited. A small abscess at the eve of bursting was manifest on the right half of the swelling, as per sketch, same size & form, & quite yellow. This was not one of the arytenoid cartilages.

The case was clear, & the disease was apparently confined to the upper part of the larynx, i.e. above the true cords. The fauces were flushed, patchy & denuded

Some dysphagia with fluids -

in several places - The cough, which she said was sometimes dreadful, began with wt in the throat, and continued till relieved by expectn of bloody mucus from thence. Does not sleep sitting up in bed.

Prognosis not bad if treatt carried out, & directions followed. Quiet, rest, avoidance of cold, speech, or excitement, all most necessary -

with a brush -

Counter irritt to upper part of neck.

The breath was very sour - As she was able to whisper pretty audibly & distinctly, the oedema does not extend to the true cords, but rather at the margins of both ventricles.

Oct 12th Upto the evening of the 9th she went on remarkably well, when she vomited something that disagreed, this produced an aggravation in the laryngeal symptoms, and she went on indifferently upto Saturday - on Sunday morning 11th at ½ past 2 I was roused up, and rode to Tottenham, and saw Mrs Lucas - There was much oppression & noisy breath-

ing, pulse 116 rather weak. Feeble as she was I applied the laryngeal mirror twice and saw that the false cords were much swollen and nearly met. The epiglottis was unaffected. As there was an absence of attacks of spasm, it was deemed prudent to allow her to take tea afternoon; and at ½ past 7 I and again met Mr Holthouse, & we found that she was much more comfortable, although she had been better from an hours sleep. Tracheotomy was therefore at once performed with positively marvellous results. The operation was a little difficult from the great depth of the parts, but was done in a few minutes. We left Tottenham at 20 to 4—

14th Was rather delicate the day of the operation, but calmed down after, & getting rid of a great quantity of accumulated mucus, and at the present time is going on exceptionally. Pulse is fair although rather quick, but that was from excitement. Breathing as tranquil as a baby. We decided to apply fresh tubes on the next visit. No ice nor nitre now.

17th Had much tenacious phlegm, but otherwise doing well. P 84 naturally feeble. A fresh double tube was introduced today by Mr Holthouse. Breathing quiet, but can speak low with finger on the tube, & is already breathing a little through the mouth. Prognosis still good.

Nov 29. Has been going on very well up to the 26th when she was poorly from food that disagreed, causing dyspheagia pain in right side of neck &c - Has been actually sitting up & walking about her room. Last night she thought something broke in the throat & gave hemichip, but no pus was spat up - I found her quiet, pulse 64, breathing easy, expectoration simply mucous, not even coloured - The retching of last 3 days had ceased. She could articulate a distinct whisper without putting the finger to the throat. The muc. mem. of throat & fauces was remarkably relaxed, pale in some parts & coloured in others. The epiglottis was thin at its upper edge, red pasteuly, and the great bulk of the swelling gone, the true cords were seen approximated, the left false cord almost normal, whilst the right was still somewhat swollen but very much reduced indeed as per sketch made at the time. Much of the expectn came from the mouth, part from the larynx & part from the space between tongue & epiglottis. I advised applns of a sol of Tannin to the fauces occasionally, & the use of Tinct of Matico 4xx in her mixt, each dose, for the relaxed condition of the throat.

1864
April 25. Passed an excellent winter, going about in her bedroom floor, and is much thinner but well. Laryngoscopy with

Just returned from Margate - has stopped here - under D Rae of Hastings? Married att is Mr Webber of Commercial Square -

Hoarseness for 9 months, and some ~~dysphonia~~ dysphagia, from swelling of the left false vocal cord, and chronic congestion of the larynx.

The Rev^d Dr Richard Williamson D.D, aet about 60, came Oct 7th 1863 at noon by appointment. Is a patient of Dr Burrows Cavendish Square, and lives at Datchworth Rectory, Stevenage. Mr Payne recommended him to come to me & he examined with the laryngoscope. Has been treated by Dr B for Dysphonia, so he said.

Has had hoarseness since Christmas, clearly originating in a cold in the head in the nose. He used the voice for 2 Sundays immediately after, and has not been able to preach since. General health good in other respects, very tall, no dysphagia, but some dyspnoea the last 2 months.
Voice is decidedly harsh and hoarse & weak.
Laryngoscopy easy altho the throat was irritable. Epiglottis was normal, but a fleshy tuberosity was seen to project down from the left side as is shown in the sketch and either involved or wholly concealed the left true vocal cord. The right vocal cord was intact although congested. The larynx did not open

as freely as it should do. Seeing how matters were I requested him to get S^r Burrows to be present at another examination, and accordingly at ¼ past 3 he came and had a fine, clear and distinct view of what is represented. S W in the mean time had eaten lunch, & this permitted of a readier view, and it was found that this swelling was above and perhaps but partially involving the canal, because a portion of the latter could be seen. The trachea was also visible much compressed. The nature of the case was talked over by S B & myself & then explained to S W.

I applied a sol hit arg with a hint to the larynx — & prescribed with S^r B's sanction

℞ Am Iod ℥j

℞ Tr Iod Co ℥ß

To paint either side of larynx with a camels hair brush q. nocte.

S W was going South & pass the winter at S^t Bs advice, but requested to come to me a few times for local applications to the larynx; before going away — The case although atrocious, did not preclude a good prognosis —

If the swelling subsides, and both cords are free, then a speedy cure may be anticipated -
Dr Burrows said the view was finer that Czermak could show upon his own person -
9th The swelling has already subsided one half, permitting a view of both vocal cords, of light carmine colour, quite distinct from the surrounding membrane. The general symptoms are otherwise the same - Applied shower bit acy -
Showed my own V.C. to him & the 2 ladies.
12th Swelling all subsided a left, but the false cord on right side is a little prominent - The edges of the true cords were seen to day white - & more even of larynx tolerably healthy -
Had not used the gargle regularly - Applied Tannin to larynx & fauces with marked relief to the voice - Pt omnia -
He looks my will, & the voice is not so hoarse -
13th Difficulty of breathing in speaking nearly gone - No cough last night - Voice more laryngeal than hoarse -
Swelling all gone from both sides, and no obstruction to the view of the trachea -
Applied 2 showers Sulf Zn to larynx & trachea and Tannin to false cords only - Pt.

14th Applied Sal Sod acy to larynx & fauces -
15th Used shower of Zinc & tannin to the fauces - The view

was good, but the action of the cords seems feeble –
Oct 17 – It would seem that the calibre of the trachea is narrowed. Cords do not come out well – Shower bit. dry –
Appearance otherwise good, mucous membrane healthy –
20th Has been in the country & there is some improvement in the hoarseness. The larynx is nearly normal, the action of the cords is sluggish, colour still pink. Applied Electricity direct to them 4 times, & shower of Zinc, with some decided benefit – also to outside of neck –
21st Examined with Dr Barrows who recognised the improvement & also in the Voice – The cords stood out better to day from the effects of the Galvanism yesterday. He was going up into the country (Berkshire) for 10 days or so to make arrangements about his departure for Spain for the Winter.

362 Commencing Laryngitis with tumefaction of the false cords -

Over

William Cannell, act 30, came to me October 11th 1883 with Dr Druitt -

A delicate looking person with aphonia 3 months, coming on suddenly, & dysphagia last few days - much pain & irritability of the throat, now the most prominent symptoms - Aphonia came once before this & got better - dysphagia last 30 days or so, but worse the last 10, although better to day -

Perfectly healthy family; contracted 10 years ago, just married - Following the syphilis 6 or 7 yrs ago, was a distinct attack of low inflam[illegible] pneumonia or tuberculization of the lung, consequent upon a severe cold. He got better, but has continued more or less ill to the present time. All his symptoms generally commence with symptoms of disease of the blood - liable to fits of diarrhoea & preceding shivering. On occasion had a most violent Haemoptysis & he got better - about 1 yr ago was exceedingly ill, symptoms of acute hectic, shivering, head aches, scanty urine &c, violent sickness. The right lung is tolerably sound, but below the left clavicle is a distinct

soft palate excavated; the whole upper lobe thereof is in a state of inflam[n] or tuberculosis - In better room, disease is quiescent. About month his troubles began, for he then lost his voice, pain & dysphagia followed -

Laryngoscopy - showed a distinct swelling, bright red, of both false cards, tapering towards the edge of the true, the narrow margins of which were seen, pushed out, and slightly serrated - There was some general redness around & a slimy appearance of syphilitic disease. There was some redness & swelling also in the lower part of the left side of the pharynx, where pain was felt in usual coming - Applied a sol Lad arg to both places -

sunlight, showed the old oedema gone, and a view of the glottis, but still narrow, and the vocal cords of a pink colour. Extract borne very well - advised use of powder of Br Am, Al &c - Sol Pot Iron & also of Tannin per Rx

1867
May 26 I visited her, and found her perfectly well in every respect, she is confined to one floor & lives in a regulated atmosphere never under 60°. Has to be careful of attacks of Bronchites - Sometimes can speak fairly loud, but usually it is an audible whisper. Regulates her diet carefully - Mr Hall & myself took tea with her.

1871
May 15. Has been going on pretty well up to the last 2 mos & for the last 15 days she has been very uncomfortable, with some general swelling of the parts about the tube, which suppurated & burst yesterday. She has a feeling as if a small bone were in the throat pricking her. Larynx shows rather a disposition to swelling in the interior, top & round about the cavity, with much secretion of pearly mucus, & great expansion of the veins of the thyroid cartilage to the extent of 3 inches. Air does pass up through the larynx but thro a very narrow space. It is just possible there may be something malignant setting in, as she is close upon 70. Her pulse is fairly good. She can swallow well. Has worn out 3 outer tubes & to day at 6 the first one was put in. I advised a poultice of bread & water & that was put about the tube. On 18th I wrote to him to syringe the throat with a draught of Bland pot 3ij Alum 3ij Glycerine 3ij Water 3vj m & e, the head turned on one side -

1872
May 2 In Times of to day was this :-

On the 30th ultimo, at her residence, West-green, Tottenham, Mrs. ELIZABETH IVES, widow of Mr. William Ives, in the 72d year of her age.

Bronchocele diffused -

Annie Leech aged 14 last May, on Octob 13th 1863 came to me with her Aunt -

Health good, but pale naturally although stout - Has always had a large neck, but has much increased the last 6 months - No pain nor dysphagia, but at times much dyspnoea especially at night -, & severe the last fortnight. Voice unaffected but not strong - Her parents both died of phthisis, & her 2 brothers died infants of the same - Is an orphan living at Camberwell 11 years - Recd by Mrs Whitbam who died in fits of Stenosis oesophagi -

Inspection The entire front of the neck, & sides to the sternum are occupied by a large prominent & uniform soft bronchocele, hard in some places - Has no cough - tolerable appetite - It measured 14 inches round the neck -

Laryngoscopy showed some flatting of trachea for pressure - Had mud had paint &c without effect -

Oct 18. Tumour quite soft & dog well. Looking very fat, but has expectd a few times without cough — Sawher since 25 July —

368 Dumbness from Closure of the Larynx, after Tracheotomy 6 years before for Croup -

Harry Harding aged 12 years, on October 14th 1863 was brought to me with his pretty sister by Dr Sturt - He had Tracheotomy performed 6 years ago for Croup after being ill with it 2 weeks - He has worn the tube ever since, can blow & whistle, but cannot breathe thro the larynx, as the passage is obliterated - His health is perfect, & he is a fine handsome looking boy - Morell Mackenzie had examined him several times, & saw as far as the cords -

Laryngoscopy - Epiglottis quite pendent & flat, but on attempting to cough by putting his finger in the tube, reflex action was excited & the cartilage drawn up a little & permitted of a view down to the cords, which were closed - but no air passed through -

I gave an opinion that something might be done by catheterism from below & perhaps above -

21st His brother told me to day that the tube was inserted by means of a trocar in the 3rd ring of the trachea. From some cause the trocar punctured the pullet, & on removing the tube 1 day, a little milk & water exuded into the trachea through a large fistulous opening, which was distinctly seen. He was then

fed on his back. The fistula remained patent probably a week longer; was very low indeed for sometime.

Oct 26 Had a view down the canal, although the epiglottis is pendant for 7/8, & they are quite closed. The tube was removed by his sister, & I used the small mirror in the opening, & found that there was no passage accessible to vision. Is subject to attacks of bronchitis. Prof Syme saw him 2 or 3 years ago, & said that he believed the passage alone had closed up. An account of this case is published by Mr Debenham in the Med Times Oct 2nd 1857.

Nov 17 Had had an attack of bronchitis. Now better. The epiglottis a little more raised. A little chloroform was given by Dr Sturt, & I then introduced a large gum elastic bougie O into the glottis, but it would not penetrate. I then used a metallic one & finally the limb of my écraseur; but none penetrated far beyond. He was not inconvenienced in the least.

Dec 15. His artic was louder & Epiglot more erect; false cards seem swollen & in pairing hands they moved as if from pressure below. I passed a probang twice in the larynx & met with pretty firm resistance, done with the aid of the mirror.

370 Dr Stuart noticed the increased sound as well as myself. I therefore prescribed Ry Am Bromid Dij
W Cinit co Zss
Syr Natives Zij
Aquae ad Zvj.
C. mag. his die.

There was no sensibility seemed of the throat, and therefore chloroform was necessary. He held his tongue and remained firm in catheterism 15.

30 June 1864 The pomum is separated in front & right side, & a space can be felt, the tube probably passes through the cricoid — epiglottis is more erect, & saw beyond the glottis as in fig. There is divarication of the glottis, & the right V.C was distinct but quite pink. left I thought appeared white in one view —

Stricture of the oesophagus 2½ inches down the tube.

Mrs Smith aet 50, was brought home Oct 14th 1863 by Dr Farley of West Malling, near Maidstone, with stricture of the oesophagus –

7 years ago after her confinement of a still born child, during which she had to strain a good deal, dysphagia commenced. It has been getting worse the last year. No solids are now swallowed. Fluids will go down with caution, or taking small quantities at a time, this I saw her do. No dyspnoea nor dysphonia. General health is remarkably good in every respect. As the sensation of obstruction was felt to be in a line with the hyoid bone Dr Farley thought the Laryngoscope might throw some light upon it.

Laryngoscopy showed the larynx normal. and 2 fleshy tubercles on the right side of the epiglottis. ○○ – but no actual disease. I passed a sponge probang down the oesophagus, & through 2 contractions by gentle pressure. There was a good deal of spasm, for it was firmly held on drawing it back. The obstruction was 2½ inches down the tube. She swallowed better after this & took

a great quantity of water without difficulty - I advised dilatation by the use of bougies - & prescribed to abstain any sub mucous deposit -

The case was satisfactory in the passage of the bougie No 7 [illegible]

Dictated in Ext 2

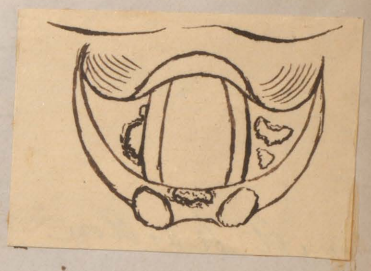
Consumption, with a very irritable and harassing cough, depending upon ulcers in the larynx; greatly relieved by care of the latter.

Captain G. W. Vanderbilt U.S.A., Oct 14th 1863 came home direct from Paris, about his throat, as his brother in law, Mr Daniel Torrance wrote me, that the Capt had heard of my celebrity in the diagnosis and treatment of throat diseases, and fancying himself that his trouble is mainly in the throat. He has been under the special care of Dr Churchill in Paris (Hypophosphites) the past 3 months. Dr C told him his lungs are healing, and that his present condition is better, but his cough does not lessen and his friends & himself too (Mr T thinks) find or fear that his general condition is worse, and are inclined to believe that a more genial clime and kind nursing is the best treatment for him now.

Capt V told me his case, of his travels for health, in the Dutch E.I. & elsewhere, & that the disease set in some 2 yrs ago from exposure in service.

He had a constant irritative cough, almost with out ~~out~~ ulceration & but showing much mischief within. Laryngoscopy was well borne & the view good.

Mucous Mem. pale & anaemic. A deep ulcer was found on the right false cord on the border of the ventricle; and 2 or 3 on the left false cord; none on the true.



The Mem was also relaxed, altho the voice was strong. He had formerly been a stout man but now very thin & pale. S C told him his disease was not equal to the cough. Shown of Zn to the larynx & Tannin to fauces. He had had the sponge previously & remarked upon the comfortable inconvenience of my topical plan.

Cough 1½ years.

Stopping at the Grand Western Hotel. He had all the usual signs of phthisis, with night sweats &c

15th He said there was a decided improvement in his throat, for he felt it more comfortable, and his cough was very much less, & he expectorated easier. Slept some hours in the night which he had not done for some time. The ulceration in the right side of the larynx was diminished one half

& there was a marked natural appearance about the nose, mem of the
larynx & fauces — Ft omnia —
Shower of Zn again — & Tannin to the fauces —
17th Still improving, cough & expect less, sleeps better — Ulcers
all healed except those on the right side, which are reduced to a
mere slit — Applied Shower Zn lis — & Tannin to the fauces —
He said he used to vomit all his meals up to the day he saw me
when from my first applic this wholly ceased — nose. mem of larynx
& fauces not so pale, & assuming a good pink colour —
Rx Rp made Acid Sulfuric 3ij
Extr Chloric 3iiss — q. 4. or 6. h.
18th Ulceration quite healed up — And as there is a difficulty
in cutting the pellicle — made Rx Camph Co 3iv
& added Rx Sanguin 3ij —
Slept even better last night than usual —
Applied Shower Zn 3 times & Tannin to fauces —
19th Good view of throat, all is normal — Get shower Zn lis
& Sol Iod acq to fauces — Slept 6 hours last night —
20th Went well, cough less, & altogether much improved —
Enjoined a nourishing diet, which had never been used to him
Slept 6 day for 5 nights — Shower of Zn lis, & Tan to fauces

Quoted in Ed 2

Acute laryngitis, with disease of the lungs and heart; peculiar condition of the epiglottis.

Mr Samuel Rhodes act 36, residing at Kirkburton, near Huddersfield in Yorkshire, I left home Dover at 9½ pm of Oct 15th 1863, per Kings Cross. I reached Manchester at ¼ past 3 am of 16th, started for Huddersfield at 5, and reached Mr Rhodes, who had sent a carriage & pair to meet me, at 7 o'clock. His medical attendant Mr Joseph Lockwood, of Kirkburton had previously been about him.

He had been subject to a cough for sometime, and throat disease for upwards of a year, very bad a few weeks ago, when the obstruction was so great that oedema of the glottis was correctly diagnosed by Mr L.

The most urgent symptoms passed away, yet with the cough & larynx together his state was critical in the extreme. He had been seen by Dr [illegible] of Manchester & others, without benefit I was told. He advised him to spend the winter in Egypt.

On my arrival, I found Mr Rhodes to be a thin spare person, pale & wan, with a decided laryngeal voice yet no dyspnoea, as the spasms had ceased some

2 or 3 days - His breathing was hurried, & on placing my ear all over the chest, I found evidences of disease at the back part of the middle lobe of the left side, where a few rales were heard of softening tubercle - The other parts altho not decidedly healthy were tolerably clear - His pulse was 142 exceedingly weak - He was coughing a little now & then & expectorating a mixture of white frothy mucus & pus - He had been subject to former attacks of rheumatism & there was the remains of old peri and endo-carditis -

Laryngoscopy was done with the aid of a good moderator lamp, as Mr R sat on the edge of the bed. The mirror was pretty well borne 4 times, and the state of the larynx fairly made out. The epiglottis was pretty pendent, bent in the middle & an acute angle, its dorsal surface being quite red & denuded of epithelium in several places, as per sketch - The interior was found to be unobstructed, and the true cords were seen, covered, & the false were swollen - This Cast was well seen on the 4th examination - The dorsal surface of the epiglottis was a particoloured thing, a mixture of deepred, pink & white - The inner rim of larynx generally pale & relaxed, the uvula projecting forwards - quite shiny & moist - tongue furred yet a

thick dark colour. I applied a solution of the Nit arg to the interior of the larynx with a brush, and afterwards sent some spray down the trachea; this did not even cause a cough, but he felt somewhat after it. I appointed for Lockwood to repeat this every other day.

I now prescribed a mixture & gargle.

To continue Glycerine he was already taking. Omit other med. To have his arrowroot & pancreatic, chops, & other nourishing diet. I advised his very early departure for the South of Europe, & mentioned Mentone. This he consented to do. My Prognosis was good if he went away quickly, but he was liable at any moment to an Exacerbation of the chest complaint & of course then the throat.

He told me privately when going he had formerly had a syphilitic one, but I said they had nothing to do with his present malady. The epiglottis certainly had the appearance of such recent from oedema — On leaving I

Incipient Follicular disease of the throat and Larynx in a Barrister.

38 ampthill Square

Mr H. Edgar Tidy, act about 27, came Oct 19th 1883 in the evening, recommended by Mr Archer - is Barrister - Cliffords Inn

In March last had a violent cold & cough; the uvula became elongated, & he is constantly swallowing as if some-thing was passed at the back of the throat, & thereupon the stomach fills with wind & he has a constant pain in front of the chest. Health good otherwise, except (so he says) indigestion. Subject to headaches - never had rheum - no cough - but expectorates a good deal - Looks well & healthy -

Larynx revealed great injury of the fauces & uvula, with incipient follicular disease of the throat & larynx - all the parts red & follicles dotted out - uvula elongated its terminal end being more. mem. thus epiglottis becoming pendant.

its terminal end being more. mem. thus
applied Sol Tannin purly to larynx
& fauces, & ordered

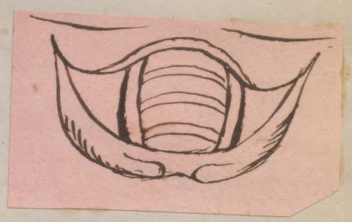
9th Is quite well, but little of the cold sensation & feeling of phlegm: after he expectorates nothing - parts seem

quite normal in mirror & even. Shows but any his -
Sails next week to Canada in one of D. M. Steamers -
To omit omnia on sailing, but to resume pastes if necessary -
& ultimately medicines - pronounced him cured -

Anaemia of the larynx & body generally, with some weakness of Voice & Chest, & an occasional hem.

Dr Cahills sister in law came to me on Oct 22nd 1863 with the Dr for my opinion as to the state of the larynx.
The Dr lives at 9 Albert Terrace Hyde Park.
She was about 58, lived in Ireland & had been attended by Dr Carrigan & Dr Hudson of Dublin. Formerly digested the rich. swallows fluids, but it causes a sharp pain, but nothing solid or tough can be got down unless well masticated small. Tender mutton & sweetbread can be got down.
Liable to dysmenorrhoea, which has reduced her much, made her pale & weak; but is better from the change of air.
Lately taken steel, &c & has good diet. & Dr was anxious to know the state of the larynx from there being a little hem.
Laryngoscope showed it to be perfectly normal, but the mucous mem: was pale & anaemic, with the vocal cords widely separated, anteriorly & posteriorly.



There was nothing for me to prescribe.

Referred to Ed L

Mr Patterson, act 48, came to me October 22nd 1863.

Feels pain at bottom of the right side of his neck and top of shoulder, mostly at night, slight dullness only during the day; has no sore throat but a thickness about it. Has a sail of rumbling within the chest, not mind, a throbbing feeling which is not palpitation of the heart; has dryness at top of the throat; sometimes a slight momentary headache. Sometimes a sad of faintness for an instant when passing off to sleep which wakens him - wakes with great perspir^n. Has a tightness across upper part of the chest on putting on his boots in the morning. Has a taste of blood in the mouth & throat & he spits some blood in the basin, both without no cough nor effort - No dyspnoea, breath occasionally short at night on waking from dreaming or in perspiration; often has bad dreams, of quarrelling, fighting, &c. Limbs have wasted; has aching of the ankles, numbness of the feet & hands, inclining sometimes to pins & needles. Stimulants after dinner causes dulness. Has had Rheum^m. No cough. Throat always red at night, & sometimes swallowing is thick. Mr Weaver at Stockwell ordered him to

Improved 2 months. Has taken Tonics, especly Phos acid dil
p.c. Bull - habits temperate - Bowels regular. Urine normal.
Complexion, faculties, appetite & digestion good
Under treatment for sometime, but has been this way for 2
years.

Laryngoscopy shows redness & relaxation of tracheo-
cords; & some congestion of the
fauces - applied Sol Tannin

Follicular disease of the Throat and Larynx.

Mr Gosling act 30, was brought to me Oct 28th 1863 by Mr Tyson of Folkestone.

Has had sore throat for 4 years, chiefly troublesome in the morning, when he expectorates Tab oz of thin slight mucus; worse in colds or errors of diet. Dysphagia with phlegm only, constant hem & secretion much like white of egg, slightly tinged with blood at times as I saw to day. No habitual cough. Has talked thick & hushey, general health good. Has a fine beard & moustache.

Laryngoscopy. showed pink circle of the fauces & throat. The entire mucous mem: of the larynx, vocal cords, & trachea red & congested, & follicles enlarged, pouring out secretion especially from the ventricles. This was also in the fauces.

Applied Sol Lad Arg to fauces, & to fauces Sol Tannin.

Feb 3 Rev Mr Bullock told me that Mr G. was very much better

404 Weakness in singing, especially of the middle and upper notes - after measles - from impaired nervous power and alteration of the voice & throat -

Mrs Inverarity aet about 26, on Oct 29th 1863 was brought home by Dr Cahill with her mother - wife of a Commissioner in India & was out there 6 years - married at 16 - hot climate agreed well with her, and there. Is pale - had measles in April last, although she also had them when a child - was a delicate child - No cough after, but repeated attacks of sore throat, ulceration of tonsil &c - Had steel - Went to Ems and was better, back a month - She has to sing under the usual voice, and has a difficulty in getting out the notes especially the middle, from a feeling of general weakness of the chest, but no dryness of neck or throat - The high notes she can manage although weak with them also - Throat often ulcered - An accomplished singer - Laryngoscope shows a beautiful chord, with weakness of the action of the cords, & a little irregularity in the action of the left, during a singing note - The sketch shows their position. The approximation was fair but not perfectly uniform -

Applied a shower of Sulf Zinc lot - & Lod acet to ear ulcer a right side of Velum &c

℞ am Bromid ʒj
Aquæ ℥ij
Glycer ℥ij

applied Sol Nit Arg. & Shower ℥ss to vocal cords.
1868
Feb 12 Dr Cahil told me she was quite cured, & sang beautifully.

Aphonia from tuberculous ulceration & chronic oedema of the false cords, associated with Phthisis in the third stage -

Miss Charlton act about 34, visited October 29th 1863 at 8 Vicarage Gardens, Church Lane, Kensington, in consultation with Dr Cahill -

She has a cavity in the left lung, but gives out. expd much but chiefly from the throat - dysphagia with fluids & throat very sore - much wasted - fauces relaxed, uvula long, a deep red ulcer in pharynx extending almost to the pericardium, from the whole column of deglutition - Laryngoscopy shows swelling of the false cords which meet behind, permitting a view of the true cords, and covered with numerous small ulcers. Here & the swelling of the cords gave rise to the dysphagia with fluids, but not soft solids - Aphonia had been present for some months as well as the sore throat - Applied Sol Zinc to the pharynx bis, & a shower bis to the larynx, with benefit, with smarting but no pain.

Quoted in Ed 2

1866
April 25 Dr Cahill told me that my treatment healed the ulcers of,

and she could swallow well after - She died 3 years after of Temper he said -

Mr Lent, act 30, came home Oct 30th 1863 with
Mr T. Carr Jackson.

Had been under him some yrs for Catarrh, of which he was well, except a curious sensation in left side of neck & face, running up to the left ear, which Jackson thought might be due to the Eustachian tube. His hair was grey & whiskers black, exceedingly nervous & weak.

Larynx showed nothing particular unless some relaxation of mucous mem. for which I applied a Sol Chromic & advised a Mixt of Iod Am, Ft Cinch Co, &c & a Gargle of Bromine &c

Feb 3. 1864 Mr Jackson told me that my treatment perfectly cured him.

410 Follicular Disease of the throat & larynx of many years standing —

Mr Stephen Love aet 39, consulted me October 30th 1863 by Mr J. F. Lovegrove of Ightham, Kent.

Is a farmer, and fond of Hunting & out door exercises — Has had a relaxed throat for years, and last year Mr L truncated the uvula & he was better; but now he has a bad cough, from some irritation of the throat, for the lungs are sound, probably Mr L touched from the Epiglottis. Much talking produces cough directly, & smoke does the same. Laryngoscopy showed an irritable throat, resisting the mirror from retching, but during many trials I succeeded in seeing all that was desired. Follicular disease of the larynx trachea & fauces, but the last tells for app[ce] of bit of silver — Coats quite red from chronic congest[n], all pouty and mucus in abundance. Ordered inhalation of larynx bis, & Tannin & fauces,

J. ter die.

Regulated his diet, habits &c —

Nov 6 - Is much better indeed, throat is clearer, the irritation is gone or much less, dont cough so much, feels stronger, talking does not cause cough and voice is better.
Lar shows change for better, gen cong[n] & irrit less.
Ht Acq Shower & Inhal & Laryn & Tannin & Glycer. Pt.
Dec 7 Nearly quite well, very little redness of larynx, probably from smoking. Has felt quite a new man. Cords very white.
Shower Ht Acq. & Tannin & Glycer - Pt for 10 days.

Briefly quoted in Ear &c

Ellen Noble aet 24, came to me Nov 3rd 1863
with a note from Mr Henry Thompson to examine her
for aphonia with symptoms of ulcerated larynx.
Married 6 years - Health had been good, with a bad
constitutional Cough; mouth sore 4 years - throat
affected 2 years, but only within the last 3 months
that her voice has been absent - 2 weeks ago was
quite dumb; now can speak in a low tone, but
she is not aphonic. Had dysphagia very bad, some
time back, was nearly starved, but not so now.
Neck has been sore & had lumps always outside.
Food sometimes comes through the nose - Can
breathe through the nose, but sometimes it's stopped
up, & blood & pus comes from the left nostril &
Can smell & taste, little deaf - [in her ears.
Has been in very bad health & taken everything - was
examined by Mandl Manhunzie -
Inspection. Uvula & central part of soft palate
entirely gone; pharynx pateley; cicatrices seen about
the sides & tip of the tongue, & a great one, & deep,

& the right of the centre -

Laryngoscopy - Epiglottis pendant, ant^r & upper edge thickened - Is elevated on inspiration & larynx seen, the vocal cords are normal, but narrow & action not very free; the mucous mem. at post part of the larynx has the merest irregularity on its surface; slight tumefaction of the posterior surface of the left false vocal cord, but the mucous membrane of the larynx generally of a healthy pink colour. Some congestion present in the subglottic space externally. The trachea is uninvaded.

Rhinoscopy. Redness & tumefaction of the mucous membrane covering the septum & desquamation of the mucous mem: as well with discoloration in the left nostril, but no visible ulceration; the vomer is ulcerated near the floor of the left nostril. Both nostrils well & easily seen, no very active disease present

Diagnosis. the thickened, altered & weak voice is due to the condition of the larynx, the position of the epiglottis the loss of part of the soft palate and state of the nose - Most probably all the result of specific disease.

Wrote the above exam^n & result to Mr Thompson -

Feb 15. 1864 - Frontal headache - deaf - much ulceration at back of nose, tongue very sore &c - was to day

admitted into Univ Col Hosp under Mr H. Thompson.
Nov 23 Harbeman & off under Mr at the Westminster Hosp -
26th Sentence to be examined -

Mr E. J. Fenemore aet 36, came home Nov 2. 1863.
Wine Merchant - lost my home 8 St Russell N.C.
was in fair health upto 12 mos ago - when he thinks
his throat was really made sore, by large quantities
of Hyd for supposed Cynanche - tongue became enormous,
swollen - Voice never lost, but speech affected at
times - has a peculiar sensation in his throat
constantly, lips parched, fingers and hands heavy
are notched and dry - No dysphagia nor dyspnoea - No pain[r] cough but a little expect[n] -
Appearance is that of pair health - much talking produces dryness of lips & throat -
Fauces & pharynx have a patchy look,
& Laryngoscopy showed some deep redness
of right false vocal cord, just above
the ventricle - all the rest normal.

℞ Am Iod ℈j c. mag.

420 Dysphonia and Hoarseness

Mary Ann Smith, aged 33, married, Nov. 2. 1863
came to my residence, but ad at Westminster Hosp on
30 Oct. recom by Mr Dunn at Farringdon dispy to me.
Has been ill 5 years, commenced with a cold. Got
wet last March & stood all day in wet; confined in
April, & Voice ever since hoarse. Lost the voice
twice, once when confined & again since. Has 3 chil=
dren living. Had Fever and Cholera during the past
Summer, life despaired of, was under Mr Cuff=
Mr Dunn lately advised her to go to the sea side.
5 years ago contracted Syphilis from her husband, &
never had health before; he is an Actor.

She has a croupy cough & hem, pain between the
shoulders, coughed all last night but not subject
to it; has great dyspnoea at times, causing pain
on the heart; much dysphonia & strain to talk.
Dysphagia for some days.

Laryngoscopy. epiglottis slightly thickened. Both
false cords are much swelled, permitting of a view of but
a narrow part of each true cord quite white and finely
serrated edges. Between the false cords posteriorly

is a sharp pointed growth extending from behind forwards as in the sketch. The true vocal cords approximate beneath the growth & speech is not thereby lost. The symptoms now thus explained –

424 Chronic Follicular disease of the Larynx, with extreme hyperaemia - Great perspirations - and other symptoms -

The Rev J. A. Backhouse of Felstead, on November 6th 1863 came to me - aet 47 Chelmsford
Has been a patient of Mr Lund of Manchester -
Had Aphonia in 1853 for 2 or 3 weeks, again in Oct 1854 for 5 weeks, again in Spring of 1860 for 2 months. A similar but shorter attack to the last in Spring of 1862. This year at end of March. Took 2 full doses in June - In July examd by Lund who found larynx much congested, & applied tannin & and quinine & steel & aquafle - He was ordered to bed by him & retd home in August. He got worse again afterwards -
He has excessive perspirations which Mr L thought the cause of the complaint. On walking &c was treated by SO_3 dil 5ss to 3ij at his die. Used brine baths for it. Pulse always quick, 90, sometimes 120 - Bowels too much open - sleep broken. Takes good diet
On seeing him he appeared to be a stout healthy robust looking person, with a voice like Dr Barnes -
Laryngoscopy - extreme congestion, relaxation & thickening of the mem of the larynx, cords, & trachea, a most uncertain

throat to depend upon. No white cards to be seen -
Fauces were a little patchy & left pharynx ulcerated -
applied Sol hit acy in shower, & Sod acy to fauces -

f. m & e.

See most copious notes sent by himself -

23rd He writes. about the voice. his progress at first was quite astonishing, though he only began the medicine on the 9th, he was able on the 11th to go through his work both morning & afternoon without fatigue. He often has fulness in the throat as if partially filled with mucus. In all other points his progress has been very satisfactory. The diminution in the perspir^n is, he says, perfectly astonishing, & he is now able sometimes to take a walk without having to change his clothes on his return. Bowels now not so often open, pulse slower, sleeps better. He came up on 28th & the fulness in the throat had gone. The change for the better amazed me. The congest^n, that^n of the entire larynx was better, the V. C were still seen of a very tinged with pink. I used a shower of Nit acy & found it restored the cards to their white colour. Sol Sod acy to the fauces -

Same directions about his diet, might eat mine for dinner & his early tea at 7 am, as he breaks fast at 8 - I could scarcely have believed the change so rapid -

Dec 28 wakes rather early in the morning & has a cast of choley fairly in the throat as if mucous was there - Gusted in Ed 2

March 13. Lol quite well. But from exten made to be a little cold & catarrh & got a little hoarse - Larx a little congestion of trachea & larynx but not vocal cords - Follicles of the pharynx are prominent & red, isolated & enlarged but not ulcerated -

Applied Lol Iod arg - Sleep impaired too -

Continued at 436

Mr Backhouses son act 6, examd Nov 6th 1863
is often hoarse in the Morning, always hem backwards
in speaking. When he Cries also he seems almost as
if he waned Choke.

Little girl also act 8, he wished to be examd
also to see that she was all right
Laryngoscopic examn showed depression of the
Epiglottis backwards in both, and it could not
be elevated by forcible pressure of the larynx. This
was done by Mr Backhouse
himself. I ordered a purge
only = twice a day for each
Dec 28. Epiglottis in son is more elevated
but not so much as in the daughter.
Left to continue the purge.

1869
March 13 His other boy now aged 7, called Arthur & little girl
Edith aged 6. Boy has partial tendency of epiglottis but
is otherwise well. Girl has it complete with ulcer
she is subject to attacks of indigestion &c
requires to be taken forward
off attacks. & purge for
the throat.

Hereditary Aphonia of 10 years duration from
Incipient local Inflammation, cured in 5 days -
from the 16th to 21st Novem -

Mrs S. C. Hawkes, act 52, came to me Nov 7th 1863
about her Voice. Husband Surgeon at Bishops Stortford.

Has had Aphonia for 10 years, coming from the shock
of the loss of her eldest son, which took her voice away.
He died from Rheumatic disease of Heart - Stimulants, tonics,
& all sorts of things tried in vain for 8 years, then Galv.
under Mr Cobb & she was decidedly worse - wore galv.
belts round neck & left side of which are great scars.
Under Dr Greenly for 3 mos & constant applic of Sol of
Caustic, & one day she hemmed for 1st time in Regent St
& sound returned, which she called "heavenly" - By perse
verance for 2 weeks, a sort of "hoarse male" voice
came back & was retained 1 month or 5 weeks, and
then went away again - This was 12 mos ago last
October. Last voice for 7 months at 17, in hard hemmet following a cold -
Taken by Greenly to Dr Johnson in May 1862, & also
to Mason & Lane opinion given as myself stated
further on that muscles did not contract & all was
nervous or constitutional - Greenly ordered change of air to Sea side -
& he looked upon it as a purely nervous affection -

When she must be greatly & was for effect & sanctimonious - effect abroad then -

She made me examine her & give my opinion before telling me her history, & she said I agreed with Dr Johnson -

Laryngoscopy, case. Larynx normal, cords nearly so, but in attempts to utter sounds, eg. ah they approach but do not meet, as per sketch - Could see nothing wrong in the trachea -

Some spasm of fauces semi relaxed -

℞ Ammon Brom 3j
℞ Mucil Vom 3ij
℞ Acid Hemid 3ij
Aquae ad 3viij.
ft Mag. t. d.

applied Galv 4 times to cord & pharynx - & shower of Sol ℞ Capsic -

9th Pain in the left ala of thyroid is one of the chief symptoms Elect Galv 4 times, to neck & cords, & Shower of fauces ℞ Nux Vom - Her mother many years ago was in the habit of occasionally losing her voice for a short time, returning by aid of stimt & warm room - Her grandmother was also subject to the same thing - Mr Money, Surgeon of Brighton, is her son in law -

16th Elect Galv to cords 5 times & to neck after - Sol of Strich to larynx ter. in shower.

℞ Nux 3ij.
℞ Sang 3ij t. d.
In the mixture added & made Br am Div

19th The left vocal cord appears especially at fault, with some slight irregularity at its posterior part, & it is on the left side that she has the pain - Galv to cords only, 4 times -

Sol arg nit 3ss ad 3ivss ℞ Acid Benzoic 3ss xv
To be rubbed nightly into T. C. { Adipis 3ij. M

19th Skin of neck already red from blisters.
Sol hit arg with brush —
20th — Do do with syringe — Inhaled Vapour of ammonia —
21st Sounds have occurred several times since yesterday, heard during the whisper, and frequently in my presence. Is a decided hem & she can clear the throat which she could not do heretofore. She feels stronger too — Shower bath ter. Inhal^n of ammonia —
The cords approximated much more & larynx is more sensitive.
23rd After the bath on 21st the voice gradually increased & she spoke quite well. It went away for ½ an h & returned in the afternoon — From 9 pm on Sat to 4 on Sunday 22nd it was absent, then returned again & has remained since, but she thinks she took cold & over fatigued herself on Sat fr much walking. To day the voice is good and strong & harmonious, & freely spoken — The cords seem to be well approximated in uttering a distinct audible sound.
Am^a inhal^n & Shower bath are given once only —
24th Voice continues perfect, approx^n of cords complete —
Am^a inhal^n & Shower bath are once only —
25th Do do one only — Voice good as before — She spoke to me & Mrs Turner & others about her cure —
19 Dec Voice perfect, and is Quoted as Cured
occasionally hoarse — anything quite normal —

1870

May 27 In Times of today appeared the following :-

"On Wednesday, the 25th May at Wind-hill, Bishop Stortford, Herts, Mary Ann, the beloved wife of Charles Hawke, and daughter of the late Mr William Edwards, of 48 Basinghall street, in her 59th year."

Hoarseness from relaxation and thickening of the membrane cover the vocal cords, for 5 months.

Mr J. T. Pearse æt 42, came to me Novem 9th 1863 from Dr Routh. Is a practitioner at St Austell.

5 months hoarse, & with a cough - { Has dyspnoea but no dysphagia - No pain - { Breast bad short - Heart broken from excessive work - Cough lately with diffy of expectn - has used tannin & Glycerine - Laryngoscopy - relaxn & thickening of mucous membrane cover the cords, & of a pale pink - Mucous of larynx pale pink also - epiglottis normal but a little relaxed.

Shower hit any portion a violent spasm, unusual -

Negro Larynx

Sore throat after Diphtheria at Rome - ulceration at back of the velum palati running into left nostril -

Mr Rasser S. Dean act ab 24, came home Nov 10. 1863 recom'd to me by Dr Fidelis of Rome, under whom he had lately been - He had a mild attack of diphtheria at Rome on Oct 27th & treated for it by Dr F. He soon recovered & took a sea voyage home which rallied him. He felt worse on coming to London, & now suffers from an "uneasy painful grating over epiglottis", sometimes deaf in left ear, and occasionally a clot of blood mixed with mucus comes from the back of the left nostril, which he can see hanging down in the mouth - Subject to sore throat since a child. 2 months ago operated upon for internal piles by Cutter -

Inspection Musc. Velum much relaxed & congested. Tonsils enlarged, much thick & long red Rhinoscopy shows bright crimson redness at back of the velum, like carmine, much ulcer'n of the velum running into the floor of the left nostril I expect, but could not see it all. The tongue was coated - Nose, left, sometimes stopped up. Applied Sol Tannin 3 times to the fauces, & back of throat Gargle - and the 2 following Receipts -

11th The approx[n] of the cards is perfect & complete in slight coughing. Indeed there seems more activity than there has been - Such rather bad last night from the unguent -
To day I applied a Sol of the Ext of Calabar Bean (prepard for me by Mr Squire of Oxford St) 3 times, with the mirror, with a feeling only of slight heat, down front of neck in line of larynx & trachea - She must have had about 12 Minims. To remain quiet for 2 hours & during the day inhale Ammonia - Pt. quiet -
12th Her sister thought she whispered louder at dinner yesterday - I applied the Sol as before - three times, & same quantity -
14th No change. Repeated Sol 3 times double the strength -
15th Sol as before his. Then small shower of Liq Am fort, wh caused some irrit[n] & Cer Acontina day comm of par vagi.
16 Sol as before ter. Sol 3 minim ℥ fauces - omit Mist.

She felt the effects of the acconite till night. and the throat was tender for some hours & the Lig Arm. - The lungs & dorsal pain
perfectly normal - I learnt she has had Leucarrhoea for
a long time, & therefore this explains why she is not cured.

17th Consultation wt Dr Sieveking at her friends residence -
Lungs quite sound, larynx & cords seen healthy by Dr S & myself.
Habitual constipn, leucarrh before Aphonia occurred - some distur=
bance of Heart's action - Indisposed to take exercise at all times -
Health out of order - Sacral pain & aching about thighs. ℞ Ferri Valerian gr xxiv

Leaves for Surry this week -

April 4th 1864. Mr Wilson her uncle told me she was the
same, fright had been tried without effect -

Aphonia in and off for 6 years, but continuously for 15 months.

Miss Sutherland, act 26, came to me Novem 11th 1863 with her mother & Mr Eccard, Surgeon of Brixton Hill. She looked as if in the last stage of debility, with pain in the back bone, feeling as if she would fall down, suffocating feel in the throat, can bear dust or smells, has indigest^n & pain all over the bowels, sleeps badly, appetite bad. Has had aphonia in & off for 6 years, but continuously for 15 months, was hoarse before she lost her voice. Catamenia irregular & absent. The appearance of the face & eyes, staring, & general aspect convinced me she had long masturbated, & this was the case of Mr Eccard. She had taken Nitric Acid, Val Zn & Quin. Calomel &c.

Laryngoscopy was difficult from spasm & raising of the tongue. a good view was obtained however of the larynx which was found congested of a deep carmine colour involving both cords, and the trachea & subglottis. The right false cord was swollen & wavy on its free edge & occasionally concealed the true cord, as in fig 1, the cords are seen in Fig 2. There was no movement in the true

cards to speak of - applied a shower of Wt arg lis -

Ry am Bromid 2iv
Sfl am acet ℥ij
M. ft. mist. aa ℥ij
Syr Scillae ℥ij

S. neg. t. d.

Prognosis good, esply under use of Br Am - & local treatment -

Wet and baffle a current breath any 3 or 4 days at bed hit arg.

Nov 25th Remarkable improvement, second the same looking girl. better in many respects. The redness & congestion of the larynx was almost wholly gone, the cords, the right especially quite white, left inactive. Swelling of right false cord subsided. applied Shower Wt arg lis -

The Bromide had been gradually increased up to ℥ij. ℥j. in the mixture -

Ry Hyd Bicarbonate ℥iv
Sodii ℥ij - M.
S. n. Dessert of powder
in ½ a ℥ -

Made her inhale also the Vapour of Ammonia 3 times, but no cough.

Dec 23. A great change in her appearance, a little more animation about her; the vocal cords were well by myself & Ward, & of a very slight pink - There has been more action about the voice, but not speech - She still carries out the old habit - Shower 3rd time -

℞ Ammonia - Br still in larger doses -

January 1. 64 wrote to her and to give Br in 20 or 30 grs t. d.

Mrs Hodge, act about 27, came to me Novem 14. 1863
with her sister & Dr David R Pearson. Very pale - Has 2 children.
of Woodbard - N.E.
She feels, as if something was in the throat & she is
constantly
swallowing to get rid of it, but still the sensation remains.
Has been so 4 months - Voice strong, never lost, but
particularly weak. General health bad; no cough,
Chest is drawn in, in front, (top) and pain down the
sides of the neck - Pain in the throat is better, but the
sensation there troubles her - The feeling there is very
rough as if the throat was full of crumbs -
Larynx showed a little congest[n] of the Larynx, & the aryteno
epiglottic folds, & slight pendancy of the epiglottis -

℞ Am Bromid 3ij Sacch Shower of 2 or 3 blisters
Aquae 3ij m & e & Tannin to fauces -
Glycer 3ij
Aquae ad 3vj.

Dr Pearson thought his hysterical pain it am[t] -

446 Extensive ulceration of the larynx and Aphonia from advanced tuberculosis; with a pendant epi= glottis; healing up of all the ulcers.

Henry Dennett aet 30, came to me Novem 14th 1863 from Dr Wright. He vomited from reflex irritation

The case was one of advanced tubercle, and Dr W thought the throat might be a good case to see tuber culous deposit in the larynx. He had aphonia for 8 months. But is worse now. Ill for 3 years. Laryngoscopy was not easy, from the great sensitiveness of the throat, yet I made out much ulceration, see sketch. affecting the true & false cords and the trachea. with extreme pallor of the mucs. mem.

I ordered Ry Am Bromid 3j
alumin 3ij
Glycer 3ij
Aquae ad 3vj.

f. mist.

Nov 21st Ry made made ad 3j & added Tr Kram 3ij. for the epiglottis is still pendant, yet a coughing, is elevated & the ulcer is seen to extend down the trachea. Sal Tamin to epiglottis.

27th Epiglottis a little more elevated, & a shower of pus was thrown down.

Ry Am Bromid 3iv

(omit mix of Tr Ja Kram Pq, quas de of D W.)

Dec 4 very much better in every respect, epiglottis
more raised - Shower of Zinc lis -
addend inhal^ns of sulp copper dissolved in hot water.
12th Voice returned 3 days ago, Inserted in Col 2
& it is fairly strong - The larynx looks better, & the ulcers surface
healing - Shower 3n - omit Wkam & make Al 3ij in purple
No pain chiefly in left wing of Thyroid & its ligament -
19th Much better - 3n shower - Neck not so sore & complexion -
January 15th 1864. Larynx much better - but cough bad in
the cold weather - does not expect so much. still uses the
inhal^s of sulp of copper nightly.
26th Is much improved, cough & throat better -
March 16 Cough same, throat sore - Am Bromid 3ij
Voice in a whisper. epiglottis still pen dent - Shower 3vie - Glycerine 3ij ad 3vj.
April 2 - Better - Sol Zinc Iod - Laryngeal Bromid 3j throat
throat rather sore, vomits frequently -
18th The lung had been of service - Cough troublesome -
May 7. Throat irritable - shewed him Dr Ramsey of Cheltenham -
28th Trust ulcer^t interarytenoid - Sol Iod arg. Cough bad.

Miss Shaw, act 19, came to me November 16th 1863
with her mother, & her Cousins, Surgeon of Camden
Town - Is a fine tall girl:
Has had throat symptoms for 4 months, following on
a skin affection now cured - Is very tall for age -
lives at Camden Road near the Prison, very high
up, but locality has nothing to do with the complaint -
Slight dyspnoea on & suffers from old weakness of
the spine, caused by St Vitus - Has pains in
the sides of the neck - Has not been able to sing
& had to stop it almost altogether -
Has a remarkably small & beautiful throat -
Laryngoscopy. showed pallor of the mucous membrane
& very slight pendulency of the epiglottis, no other
disease whatever - Face will remain all this month
the tonic med - To resume her singing & practice -

450 Follicular disease for five years, with husky voice and inability to read aloud; cure in three weeks.

The Prince D'Estang came to me Novem 11th 1863
accompanied by Baron Hoeter. Act about 45
His highness had been suffering from husky voice for 5
years, with disease of his throat, and inability to
read aloud for any length of time. He had been
treated by men of eminence at Paris and in Germany,
and had been much at Watering places without benefit.
His general health was good in other respects, but he felt
depressed & uncomfortable at times about his throat.
Inspection showed general enlargement of the follicles of
the pharynx, & relaxation of the entire uvula: mem:-
The pharynx was much congested, relaxed, membrane
swollen, & pouty and mucous; a few clusters of
follicular irritation were visible here & there.
Below the cords the trachea was much congested.
The epiglottis too was very red & shiny.
Sol of Nit Arg was freely applied to the pharynx and
tannin to the fauces. and

℞ Am Iod ℈j c. mag ℈ss Together with

Aquæ ad ℥viij.

jungle - To be regular in his habits of living, avoiding acid wines - He is a good liver -

Topical treatment was applied every 2or 3 days for a fortnight, when all these conditions disappeared, and in 3 weeks his Hoarseness was cured -

Quoted in Ed 2

Rev Wm Nares continued from page 335

He breathes thro the nose with a noisy sound, but when thro the mouth it is stridulous; & he speaks in a laryngeal voice Breathing been bad ever since his visit last to town, when he took cold on his return & had bronchitis -

Laryngoscopy showed pinkish discoloration of both V. C. with thickening - the left scarcely acted at all, whilst the right was movable & prominent - Could not see beyond the glottis -

21 April - View was better; the glottis was seen, very narrow like fig 2, with the right cord prominent & a swelling upon its surface like fig 3, the left being almost immoveable. Naturally the view was like fig 1, the cords

1

2

3

The anterior cartilages were immoveable -

Epiglottis overlapping the right arytenoid cartilage. Remainder beyond the glottis was not clear, but no posterior growth was seen beyond that described. Considering the narrow glottis, the great dyspnoea and the stridor, I advised early tracheotomy, which was concurred in by Mr Terry & Dr Cock, & tomorrow was arranged for it.

22nd At ½ past 2, Mr Hallhouse performed the operation with Mr Nares placed upon a sofa. The neck was so short, and the distance from the end of the cricoid cartilage to the sternum not more than an inch and a quarter, that it was no easy task. Everything was done as usual & the trachea opened; but now occurred great difficulty, the rings were ossified & would not let the knife through them, nor the tube in, after division. There was besides severe venous hemorrhage, & matters looked bad. I staunched the blood as fast as I could, and finally Mr Hallhouse got in the tube and Mr Nares quickly recovered himself, and breathed calmly and quietly. A little over 0ss was lost. Mr Terry & Dr Cock were likewise present & Mrs Nares. It was one of the most dangerous cases I have ever seen.

Vespere. He was going on very well, not an untoward symptom, no phlegm nor mucus. pulse good & soft. breathing quietly without noise. Ice. Jelly. Soda water &c

23rd 1½ pm. Doing very well, but a little pouty & f. intermit. vespere the tube came out & had to return from the seat of the opening to left side & unyielding state of the rings.

24th noon - Easy but easy - p100 -
8 pm - Ditto - close troublesome - Lotion of Brom, Gly & Aqua -
25th 5½ pm - Weak & low pm - much pain - Pot Iod 3ij
Had breathed very comfortably - Pot Bicarb 3ij c. mag
Nose never so comfortable as now - Tr Card co 3iv " 9.6.h
Spt Am arom 3ij
Tyr Benzoin 3ij
Aquae ad 3viij: m
26th Very much better pm the night, breathes easy and quiet. 27th Had a bad night -
28th at 1½ pm - Mr Hallhouse made a circular opening in the centre of the trachea by cutting away portions of the ossified rings with scissors, yet no tube, not even the new one could be inserted. Later we obtained the advice and assistance of Mr Prescott Hewett, when the incision was extended further upwards & the cricoid cartilage laid bare. It was divided with bone nippers, and attempts made to take away its under part, & then new and large tube was successfully introduced and all further trouble was brought to an end. He was quite comfortable when I saw him at 9 pm -
29th Doing very well - (3 pm) the tube was lined with a hard cylinder of blood & mucus, which was removed with difficulty & not without danger. At 8 pm I succeeded in introducing the inner tube - eats & sleeps well.
30th Called up at 3½ am to loosen tape & tube - at 3 pm he was better, but weak - pulse 92.
May 1. Comfortable - slept well - p84 - 8 oz Wine - eaten more.
3rd Doing well - His wife Carl down with fever since yesterday.
4th Idem - The maid Martha ill to day with fever -
6th Idem - sitting up, wound contracting. Warwick Square
11th Moved to Rooms to day to Lady Aly Churchill's, No 12 L.
24th Is quite well so to speak.
30th He returned home to Wittersham.
